EXECUTIVE SUMMARY

This Performance Monitoring Report (PMR) presents the results of activities associated with the monitoring of the Enhanced *In-Situ* Bioremediation (EISB) at Installation Restoration Program (IRP) Site 70 (Research, Testing, and Evaluation Area), at Naval Weapons Station (NAVWPNSTA) Seal Beach, Seal Beach, California (Figure 1-1), which is being implemented to treat elevated levels of trichloroethene (TCE), cis-1,2-dichloroethene (cis-DCE), and vinyl chloride (VC). This PMR has been prepared on behalf of Naval Facilities Engineering Command Southwest (NAVFAC SW) under Contract No. N62473-09-D2610, Delivery Order No. 0006.

The remediation at IRP Site 70 is being conducted under the IRP Program. NAVWPNSTA Seal Beach is an active federal facility and is not on the National Priorities List. The lead federal agency is the Department of the Navy. California Department of Toxic Substances Control, and the California Regional Water Quality Control Board Santa Ana Region are the state regulatory agencies providing support and oversight.

The EISB remediation activities are being conducted in accordance with the technical and functional requirements specified in the Remedial Action Work Plan (Environmental Chemical Corporation [ECC]/Geosyntec 2008a). Field activities are being performed as established in the Standard Operating Procedures contained in Attachment B-2 of the Sampling and Analysis Plan (SAP) and SAP Addendum (AIS-TN&A 2011). Variances to the monitoring schedule are discussed in Section 4. Emulsified vegetable oil (EVO) and *Dehalococcoides* (Dhc) bacteria in the form of the KB-1® culture have been injected into the source area Source Area Treatment Grid (SATG) and into 6 downgradient biobarriers: Source Area Biobarrier (SAB), First Sand Biobarriers (FSB)-1 and FSB-2, Shell Horizon Biobarriers (SHB)-1 and SHB-3, and the Second Sand Biobarrier (SSB-1). The SATG and the 6 biobarriers treat contaminants of concern (COCs) in 4 hydrostratigraphic zones including the Upper Fines, First Sand, Shell Horizon, and Second Sand. EISB injections were completed in all seven areas between November 2008 and August 2010 (Insight 2009a, 2010, 2011).

The 2011 performance monitoring event documents the following field activities (Table 1-1, Figure 1-2):

- Groundwater-level elevations were measured during two events: July (74 wells) and October 2011 (76 wells).
- Groundwater samples were collected during two events in July/August 2011 (Summer 2011), and October/November 2011 (Fall 2011). The Summer 2011 groundwater sampling event consisted of collection of groundwater samples from 48 monitoring and injection wells. The Fall 2011 groundwater sampling event consisted of collection of groundwater samples from 80 monitoring and injection wells and analyzed for volatile organic compounds (VOCs), dissolved hydrocarbon gases, volatile fatty acids (VFAs), anions, total dissolved solids, alkalinity, total organic carbon

(TOC), dissolved hydrogen sulfide, dissolved metals, and Dhc with VC reductase A gene (*vcr*A) (Table 1-1).

- Field parameters (groundwater temperature, potential of hydrogen, dissolved oxygen (DO), oxidation-reduction potential (ORP), specific conductance, turbidity) and depth to water, were measured as part of the performance monitoring for the EISB activities, per the schedule outlined in Table 1-1.
- One new Second Sand monitoring well, designated as MW-70-49, was constructed in September 2011. The purpose of the Second Sand well at this location was to determine the downgradient concentration of VOCs in the Second Sand with respect to MW-70-14 and to better define the northeast lateral extent of the dissolved plume with respect to the SSB-1. In addition, RDO-4 was re-drilled and constructed in September 2011 since the casing had been found to be compromised prior to FSB-1 injection activities in December 2009. Well construction, lithologic logs, and survey details are documented in Table 1-2 and Appendix F.
- Twelve soil vapor probes were sampled for methane and hydrogen sulfide.

The data from the performance monitoring events were used to develop recommendations for future EISB activities in the different hydrostratigraphic zones. Review of the performance monitoring data indicates that that EISB activities in all 4 hydrostratigraphic zones and 7 biobarrier areas, are promoting reductive dechlorination to VC and ethene, with the extent of degradation somewhat variable.

Multiple lines of evidence were evaluated and support that EISB is working effectively at the biobarrier areas at IRP Site 70. The remedy performance is summarized as follows:

1. The presence of TCE in the Source Area at 2,800 micrograms per liter (µg/L) and a maximum site-wide TCE concentration of 3,900 µg/L in MW-70-PMW06B, upgradient of FSB-1, indicates that high concentrations of TCE in the Source Area upgradient of FSB-1 is present.
2. A significant reduction of total moles of all COCs is observed in all hydrogeologic zones since active remediation began. The 2011 performance monitoring data suggest that degradation rates have slowed in all biobarriers. The primary transformation product is cis-DCE.
3. Electron donor concentrations were measured as TOC and VFAs in select wells. TOC concentrations decreased in the SAB, FSB-2, SHB-1, and SSB-1. In 2011, groundwater VFA results for the injection wells were non-detect for almost all injection wells except for IW-70-SAT35 (SATG). In general, the concentration of VFAs in the PMWs remained below or at detection limits with one exception. These data indicate that EVO is being consumed by the fermenting population and utilized by anaerobic populations such as methanogens and dechlorinators.
4. In biobarriers SATG, SAB, FSB-1, SHB-3, and SSB-1, sulfate has been increasing and methane concentrations have generally been decreasing, indicating a reduction in methanogenesis in these biobarriers. A review of the performance monitoring wells in biobarriers FSB-2 and SHB-1 shows somewhat more variability.

5. Within all of the biobarriers, the DO concentrations were below 1 mg/L during the 2011 Performance monitoring event, except for IW-70-SHB310 in the SHB-3 biobarrier. ORP readings collected during the 2011 monitoring events indicated that all of the upgradient and downgradient PMWs and biobarrier wells were within the range of -100 and -300 millivolts. There is a slight increasing trend of ORP reported in performance monitoring wells in biobarriers SATG, SAB, and FSB-1.
6. In the SATG, SAB, FSB-1 and FSB-2 biobarriers, in general, Dhc and *vcr*A concentrations were within or sometimes above the moderate range (10^4 to 10^7 cells/L) of concentrations. However, *vcr*A and Dhc concentrations were more variable and primarily below the lower limit of the moderate concentration range (10^4 to 10^7 cells/L) in some of the downgradient performance monitoring wells in SHB-1 (MW-70-PMW10), SHB-3 (PMW-12A) and SSB-1 (MW-70-PMW14B).

The Conceptual Site Model (CSM) was updated to provide an analysis and visualization of both the subsurface hydrogeology and dissolved phase plume morphologies. The highlights of the CSM update for the 2011 PMR are summarized as follows:

- Groundwater elevations have increased approximately 2-12 feet in all hydrostratigraphic zones since 2010, which may be attributable to an increase in rainfall in Water Year 2011. Hydraulic gradients and directions remain similar to 2010. Groundwater monitoring data does not indicate that the injection of the biobarriers has impacted groundwater flow.
- The updated extent of the 250 µg/L plume for TCE was simulated using EVS in two- and three-dimensions and demonstrates that the post-EISB TCE dissolved plume has decreased in width, length and vertical distribution compared to the baseline CSM. The extent of cis-DCE and VC plume morphology in 2011 remains similar to 2010.
- The dissolved phase plume remains within the point of compliance boundary.
- Soil vapor monitoring at soil vapor wells, constructed at 6 feet bgs, indicates that methanogenesis is occurring in the SATG and SAB areas. However, the methane monitoring on the surface indicates no harmful vapors in the breathing zones monitored adjacent to utility corridors that may provide a potential pathway to the surface.

The addition of the new Second Sand well MW-70-49 in 2011, northeast of the SSB-1, defines the northeastern portion of the dissolved plume in the Second Sand. In addition, the toe of the Second Sand plume appears to be stable in 2011.

Based on the results of the 2011 PMR at IRP Site 70, the following recommendations are made:

1. In review of all the multiple lines of evidence, it appears that additional EVO injections in all biobarriers may be prudent to ensure that electron donor are present and that the *vcr*A population thrives. In order of priority, the following biobarriers may be prioritized: SSB-1, SAB, and FSB-1based on the rate of consumption of EVO and the current VOC concentrations.
2. Based on the results of the 2011 PMR, semi-annual groundwater monitoring is recommended for the next performance monitoring year per Table 6-1. Optimization strategies may be

further evaluated after each event and incorporated as needed to enhance performance monitoring results.

3. Since methane can accumulate in the subsurface and migrate to the surface, continued monitoring of methane in the vapor probes and monitoring at the surface is recommended. Special care (venting, use of explosion-proof meters, etc.) must be taken prior to any sampling or intrusive activities in this area to minimize the risk of fire or explosion. A methane monitoring plan has been put in place to ensure that onsite workers are protected. In addition, air monitoring for VOCs in these areas will be implemented as part of the monitoring plan.

The data presented in the 2011 PMR support the remedial action goals for IRP Site 70 (Geosyntec 2006a) and demonstrate the remedial action is reducing the contaminant concentrations at IRP Site 70.

Section 1
INTRODUCTION

This Performance Monitoring Report (PMR) presents the results of injection activities for the Enhanced *In-Situ* Bioremediation (EISB) at Installation Restoration Program (IRP) Site 70 (Research, Testing, and Evaluation [RT&E] Area), at Naval Weapons Station (NAVWPNSTA) Seal Beach, Seal Beach, California (Figure 1-1). The PMR has been prepared on behalf of Naval Facilities Engineering Command Southwest (NAVFAC SW) under Contract No. N62473-09-D2610, Delivery Order No. 0006.

The remediation at IRP Site 70 is being conducted under the IRP Program. NAVWPNSTA Seal Beach is an active federal facility and is not on the National Priorities List. The lead federal agency is the Department of the Navy. The California Department of Toxic Substances Control, and the California Regional Water Quality Control Board (RWQCB) Santa Ana Region are the state regulatory agencies providing support and oversight.

NAVFAC SW directs the remedial action (RA) in accordance with requirements of the Comprehensive Environmental Response, Compensation, and Liability Act and the National Oil and Hazardous Substances Pollution Contingency Plan. The Final Remedial Action Work Plan (RAWP) defines the site-specific requirements for implementation of EISB at IRP Site 70 (Environmental Chemical Corporation [ECC]/Geosyntec Consultants [Geosyntec] 2008a). The performance monitoring field activities documented in this PMR, were conducted between July and December 2011 (Table 1-1).

The EISB remediation activities are being conducted in accordance with the technical and functional requirements specified in the RAWP (ECC/Geosyntec 2008a). Field activities are being performed as established in the Standard Operating Procedures (SOPs) contained in Attachment B-2 of the Sampling and Analysis Plan (SAP) and SAP Addendum (AIS-TN&A 2011). Variances to the monitoring schedule are discussed in Section 4.

The 2011 Performance monitoring event documents the following field activities (Table 1-1, Figure 1-2):

- Groundwater-level elevations were measured during two events: July (74 wells) and October 2011 (76 wells).
- Groundwater samples were collected during two events in July/August 2011 (Summer 2011), and October/November 2011 (Fall 2011). Table 1-1 summarizes the number of wells sampled and the associated analyses and field parameters associated with these wells for each of these events.
- One new Second Sand monitoring well, designated as MW-70-49, was constructed in September 2011. The purpose of the Second Sand well at this location was to determine the downgradient concentration of VOCs in the Second Sand with respect to MW-70-14 and to better define the northeast lateral extent of the dissolved plume with respect to the Second Sand Biobarrier (SSB)-1. In addition, remedial design optimization (RDO)-4 was re-drilled and constructed in

September 2011 since the casing had been found to be compromised prior to First Sand Biobarrier (FSB)-1 injection activities in December 2009. Well construction, lithologic logs, and survey details are documented in Table 1-2 and Appendix F.

- Twelve soil vapor probes were sampled for methane and hydrogen sulfide.

The groundwater monitoring well network shown in Figure 1-2 consists of wells screened within five hydrostratigraphic units designated as: Upper Fines, First Sand, Shell Horizon, Second Sand, and Deep Sand. The monitoring well network wells were designed as follows (Geosyntec 2006b):

1) Monitored Natural Attenuation (MNA) or "sentinel" wells provide early indications of undesired plume migration and provide information with regards to attenuation of lower concentrations of trichloroethene (TCE) on the fringe of the plume;

2) Performance Monitoring Wells (PMW), located along the core of the plume between biobarriers, provide some indication of potential biobarrier operation timeframe; and

3) Point of Compliance (POC) Wells are monitored to determine if the plume is migrating off the station.

The majority of these wells were installed in 2007 during the RA construction phase of the project (ECC/Geosyntec 2008b, 2009) and were sampled for the first time during the baseline monitoring event in 2008. The 2011 annual monitoring event included analyses of samples collected from monitoring MNA, PMW, and POC wells monitored during the 2008 baseline monitoring round (Insight 2009a) as well as injection wells that were sampled to monitor the remedy performance at the biobarriers per the schedule outlined in Table 1-1.

EISB injection at IRP Site 70 began in November 2008 after the conclusion of baseline groundwater monitoring activities. To date, installation of all seven injection biobarriers have been completed with one round of injection activities. Injection activities of the biobarrier areas were performed in the following sequence:

1. Source Area Biobarrier (SAB), was completed on January 30, 2009 – documented in the 2009 PMR (Insight 2010).
2. SSB-1, was completed on March 18, 2009 – documented in the 2009 PMR (Insight 2010).
3. Shell Horizon Biobarrier 3 (SHB-3), was completed on September 25, 2009 – documented in the 2009 PMR (Insight 2010).
4. FSB-2, was completed on November 24, 2009 – documented in the 2010 PMR (Insight 2011).
5. FSB-1, was completed on February 12, 2010 – documented in the 2010 PMR (Insight 2011).
6. SHB-1, was completed on April 7, 2010 – documented in the 2010 PMR (Insight 2011).

7. Source Area Treatment Grid (SATG), was completed on August 3, 2010 – documented in the 2010 PMR (Insight 2011). The additional SATG wells (IW-70-SAT35 through IW-70-SAT57) were installed in April and May 2010 (Figure 2-1) after conclusion of injection activities at FSB-1, FSB-2 and SHB-1. The EISB field activities at the SATG was performed last, in order to ensure that the IRP Site 70 remediation activities do not interfere with Environmental Security Technology Certification Program demonstration project performed by Camp, Dresser, and McKee (CDM), which was completed in December 2009.

Analytical methods are summarized in Table 1-1 and Section 2.

The data from the groundwater monitoring events were used to develop recommendations for future EISB activities in the different hydrostratigraphic zones.

1.1 PURPOSE

An EISB system was implemented at IRP Site 70 for treatment of dense non-aqueous phase liquids (DNAPLs) and dissolved phase chlorinated solvent plumes. The EISB is a semi-passive approach comprised of biostimulation and bioaugmentation, which incorporates a grid of treatment wells in the source area and rows of injection wells that transect the dissolved phase plume, into which electron donor and bacteria are added. Emulsified vegetable oil (EVO) is used as the electron donor and injected into the wells using a recirculation approach that facilitates its distribution. In addition, injection wells receive a one-time addition of dechlorinating culture (KB-1®) capable of complete dechlorination of TCE to ethene.

The remedy design was based on the vertical and lateral extent of the 250 micrograms per liter (µg/L) TCE plume per previous monitoring results (ECC/Geosyntec 2008b, Bechtel Environmental, Inc. [BEI] 2006). Active treatment will be terminated once the TCE concentrations in groundwater are reduced to 200 µg/L. MNA will be employed after the active treatment phase until target cleanup goals (TCGs) for contaminants of concern (COCs) are achieved (Table 1-3).

Table 1-4 summarizes the components of the performance monitoring and why they are monitored. Analysis of these parameters during and after injection, ensure that the biobarriers are working as planned.

1.2 BACKGROUND

IRP Site 70, also known as the RT&E Area, is located south of Westminster Boulevard and east of Seal Beach Boulevard (Figure 1-1). IRP Site 70 encompasses approximately 40 acres. Groundwater at IRP Site 70 is impacted by chlorinated solvents, primarily TCE and associated degradation products. Groundwater impacted by TCE extends to a depth of approximately 160 feet (ft) below ground surface (bgs) (ECC/Geosyntec 2008b; BEI 2006). The remedial approach for the site was first presented in the Revised Feasibility Study (Geosyntec 2005). Previous investigations are summarized in the RAWP (ECC/Geosyntec 2008a) and the Fifth

Annual Groundwater Monitoring Report (BEI 2006). The EISB baseline results and 2009 and 2010 performance monitoring of the biobarriers have been documented (Insight 2009a, 2010, 2011).

IRP Site 70 consists of multi-story office and production buildings, asphalt-paved parking areas, an assortment of aboveground tanks and attendant above- and below-ground piping distribution systems, and several concrete-lined sumps. From 1962 to 1973, the National Aeronautics and Space Administration (NASA) utilized the area for the design and manufacture of the second stage of the Saturn V launch vehicle for the Apollo Program. Subsequent to NASA leaving the area, the United States Department of Energy and Garrett Engineering (Allied Signal) conducted pilot test assembly operations for a classified uranium enrichment process in portions of Building 112. The tests were conducted from 1980 to 1985 but did not include either the manufacture or enrichment of uranium. Currently, the building is used for storage, communications research, and office space.

The Final Removal Site Evaluation Report for IRP Site 70 (Bechtel National, Inc. [BNI] 1996) addressed potential waste from the following areas:

- Bulkhead Fabrication Building 128;
- Vertical Assembly and Hydrotest Building 112;
- Pneumatic Test, Paint, and Packaging Building 122;
- Tool and Maintenance Building 130;
- Structural Test Tower; and
- Water Conditioning Plant.

Operations at these facilities included the use of diluted acids, VOCs (including chlorinated solvents such as TCE), phenolic compounds, petroleum oils, sodium dichromate containing hexavalent chromium, detergents, metals containing paint wastes, and machine lubricating oil.

1.2.1 PHYSICAL SETTING AND SITE CONDITIONS

NAVWPNSTA Seal Beach is situated at latitude 33° 45’ 27” N and longitude 118° 4’ 22” W, San Bernardino Baseline and Meridian. NAVWPNSTA Seal Beach is located within the Los Angeles-Orange County coastal plain. Most of NAVWPNSTA Seal Beach lies in the flat alluvial deposits in the southeastern portion of the Los Angeles Basin. The Los Angeles Basin is bounded on the north by the Santa Monica Mountains, to the northeast by the Repetto and Puente Hills, to the east and southeast by the Santa Ana Mountains and the San Joaquin Hills, and to the south, southwest, and west by the Palos Verdes Hills and the Pacific Ocean. NAVWPNSTA Seal Beach slopes evenly from approximately 20 ft above mean sea level (MSL) in the northwestern part, near IRP Site 70, to sea level in the tidal flats of the Seal Beach National Wildlife Refuge in the southeast (Figure 1-1, ECC/Geosyntec 2008a). The most pronounced

feature at NAVWPNSTA Seal Beach is part of the Landing Hill on the southwest at a maximum elevation of 50 ft above MSL (ECC/Geosyntec 2008a).

The climate in the area is classified as a marine-influenced southern California coastal region with temperature ranges from winter lows that range from 30 degrees Fahrenheit (°F) to summer highs around 90°F. Annual precipitation is variable with an average of 12.5 inches. Precipitation data for Water Year (WY) 2011, between October 2010 and September 2011, is presented in Appendix G. Prevailing winds average 4 miles per hour from the west with occasional strong dry winds ("Santa Anas"), and occur in the fall and winter. Groundwater levels are influenced by years of high precipitation or drought, as well as tidal cycles (ECC/Geosyntec 2008a).

The sequence of stratigraphic units underlying NAVWPNSTA Seal Beach from youngest (shallowest) to oldest (deepest) is:

- Recent Alluvium with a maximum thickness of approximately 80 to 100 ft bgs. The upper 50 ft consists of fine sands, silty clays, and clays; lower unit consists of sands and gravels, silty sands, silty clays, and clays.
- Upper Pleistocene Lakewood Formation is present at the site starting at depths of approximately 80 to 100 ft bgs and extending to depths of approximately 350 ft bgs, beyond the scope of the investigations at IRP Site 70. Units are discontinuous and contain zones of high and low permeability (DWR 1961).
- Lower Pleistocene San Pedro Formation.
- Pliocene Pico Formation.

NAVWPNSTA Seal Beach is located in the Newport-Inglewood fault zone. Two faults, the Seal Beach fault and the Los Alamitos fault, are part of the Newport-Inglewood fault zone. The Seal Beach fault is located in the southern portion of the Newport-Inglewood fault zone. On the station, the Seal Beach fault has uplifted Upper Pleistocene deposits at Landing Hill and Hog Island (JEG 1995). Movement along the fault appears to not have displaced recent sediments. The Los Alamitos fault lies parallel to the Seal Beach fault and about 2.25 miles northeast of the Alamitos Gap (Appendix I).

1.2.2 SITE SPECIFIC HYDROGEOLOGY

NAVWPNSTA Seal Beach is located at the southwestern corner of the Orange County Basin. The Orange County Basin contains the Artesia, Gage, Hollydale, Jefferson, Lynwood, and Silverado aquifers. The Lynwood and Silverado aquifers are merged across most of the station (JEG 1995).

There are four general aquifer zones identified at NAVWPSTA Seal Beach and include (JEG 1995):

- a semi-perched, unconfined zone within the upper Recent alluvial deposits;
- a confined fresh groundwater zone contained in lower Recent alluvial deposits;

- Late and Early Pleistocene deposits of the Lakewood and San Pedro formations, respectively, and in some parts, deposits of the Late Pliocene Pico Formation; and
- a confined zone of saline water underlying the freshwater zone.

The shallow groundwater underlying NAVWPNSTA Seal Beach (upper Recent Alluvium deposits) is within the Lower Santa Ana River Basin (Orange County management zone) (RWQCB 1995, with Amendment R8-2004-001 2004). Beneficial uses of groundwater within the Orange County management zone include municipal and domestic supply, agricultural supply, industrial service supply, and industrial process supply. Shallow groundwater underlying IRP Site 70 does not serve as a water source for any of the beneficial uses designated in the Water Quality Control Plan, Santa Ana River Basin (Basin Plan) (RWQCB 1995).

The principal freshwater body (lower Recent Alluvium deposits and Upper Pleistocene Lakewood Formation) is a large confined aquifer occupying two zones. The first zone is approximately 75 to 200 ft deep and saline. The second zone is approximately 250 to 1,000 ft deep and freshwater. This second zone is the primary water supply source for neighboring cities. Groundwater levels in this principal freshwater zone fluctuate from year to year due to variations in pumping, infiltration, and recharge. Recharge to this aquifer is primarily from unconfined areas upgradient and from unlined rivers that are hydraulically connected to the aquifer. Seasonal variations occur with highs in the wet winter months and lows in the dry summer months when large quantities of water are used for irrigation (JEG 1995).

The six hydrostratigraphic units presented in the Final Technical Memorandum (ECC/Geosyntec 2008b) are:

1. **Upper Fines Unit (ground surface to approximately 60 ft bgs)**. The Upper Fines Unit comprises three zones: a) a shallow zone of surficial soils and recent clayey sediments; b) an intermediate zone of interbedded silts, clays, and sandy silts and clays that include a semi-perched zone; and c) a lower zone of interbedded silts, clays, and fine- to coarse-grained, silty to clayey sands. A zone of organic material, mainly wood chips, was encountered in a number of boreholes at a depth of approximately 45 to 50 ft bgs.
2. **First Sand Unit (approximately 60 to 105 ft bgs).** The First Sand Unit consists of poorly-graded, fine-grained sands and silty sands. A coarse sand/fine gravel layer was encountered in several borings between 80 and 95 ft bgs. This coarse layer lies just above or slightly within the underlying Shell Horizon Unit. The First Sand Unit varies in thickness from approximately 30 to 50 ft.
3. **Shell Horizon Unit (approximately 105 to 135 ft bgs).** The Shell Horizon Unit is characterized by a sequence of interbedded clays, silts, sands, and gravels with laterally discontinuous interbeds of dense shells and shell fragments. This unit is characterized by a sequence of interbedded clays, silts, sands, and gravels below the source area grading to predominantly fine grained sand in the vicinity of RDO wells RDO-6A and RDO-6B between 1st and 2nd Street (Figure 2-17) in the dissolved-phase plume area. This unit has been subdivided into the Shell Horizon (interbedded clays) and Shell Horizon (fine-grained sands) to reflect differences in the hydrogeologic

characteristics and potential plume migration behavior. Shell and gravel layers were encountered in some but not all borings, comprising interbeds within the Shell Horizon Unit that do not appear to be spatially extensive. Wood chips were encountered in several borings at a depth of about 110 ft bgs.

4. **Second Sand Unit (approximately 135 to 170 ft bgs)**. Similar in character to the First Sand Unit, however, this deeper unit appears to be slightly coarser in its upper section.
5. **Deep Clay Unit (approximately 170 to 190 ft bgs**). The Deep Clay Unit consists of an upper clay to silty clay horizon and an underlying clayey silt, silt, sandy silt, or sandy clay layer. The upper clay to silty clay horizon appears to be a continuous low-permeability unit that is encountered at depths ranging between 164 to 176 ft bgs. The upper clay to silty clay unit grades downward to clayey silt, silt, sandy silt, or sandy clay. This underlying layer is 3 to 20 ft thick, extending to depths of 175 to 188 ft bgs. Below the clayey silt, silt, sandy silt, or sandy clay layer is a silty sand and sand layer, up to 6 ft thick, which has been found to a depth of 191 ft bgs in extended removal site evaluation borings at NAVWPNSTA Seal Beach.
6. **Deep Sand Unit (approximately 190 ft bgs and below)**. The Deep Sand Units, where encountered, consists of variable sands (i.e., fine-grained sands and silty sands) and appears to be similar in character to the First and Second Sand Units.

1.2.3 NATURE AND EXTENT OF CONTAMINATION

The nature and extent of contamination at IRP Site 70 is based on previous and current groundwater and soil investigations at IRP Site 70 as well as the baseline groundwater monitoring report, and formed the basis of the current EISB design (BEI 2002, 2006; Geosyntec 2006b; Insight 2009a).

Groundwater contamination at IRP Site 70 may be described in two distinct areas:

(i) A source area, located between 0 to 60 feet bgs in the Upper Fines unit, with suspected residual DNAPLs, and dissolved TCE concentrations exceeding 1,000 µg/L; and

(ii) A dissolved-phase VOC plume extending downgradient in a south-southeasterly direction from the source area.

The principal COC in the dissolved-phase plume is TCE. The areal extent of the dissolved TCE plume in groundwater, prior to implementation of the EISB, was approximately 4,000 ft by 1,200 ft, with vertical migration to depths of approximately 160 ft bgs. The water table is approximately 20 ft bgs, although it can be shallower in wetter years (Insight 2009a; BEI 2006). The dissolved-phase plume is identified in the following three hydrostratigraphic units; a) the First Sand Unit (60 to 105 ft bgs), b) the Shell Horizon Unit (105 to 135 ft bgs), and c) the Second Sand Unit (135 to 170 ft bgs). The results of the 2011 EISB monitoring of groundwater documents the change in the size of the dissolved TCE plume and daughter products.

The TCE plume morphology is consistent with the previous conceptual site models (CSMs) for IRP Site 70 (Insight 2009a; ECC/Geosyntec 2008b), where the termination of the fine-grained horizons causes a downward “stair casing” of the TCE plume. The CSM has been updated to

reflect the new morphology of the plume as a result of the active EISB remediation activities (Section 3).

1.3 REPORT ORGANIZATION

This PMR is organized as follows:

- Section 2 summarizes fieldwork activities, remedy performance and the results of groundwater quality monitoring,
- Section 3 presents the conceptual site model update and the results of the soil gas survey monitoring,
- Section 4 presents variances from the work plan and Quality Assurance (QA)/Quality Control (QC) Summary,
- Section 5 presents the summary and recommendations,
- Section 6 lists the references utilized in this report,
- Appendix A presents field sample collection and purge logs, and methane monitoring logs,
- Appendix B presents chain of custody documentation,
- Appendix C presents laboratory analytical results,
- Appendix D presents laboratory data validation reports and summary of the QC results,
- Appendix E presents the database export of analytical results since 2008,
- Appendix F presents lithologic logs and survey report for MW-70-49 and RDO-04
- Appendix G presents detailed graphs and performance monitoring trends,
- Appendix H presents the 2008 Baseline Plume Maps,
- Appendix I presents Orange County Water District Well Information, precipitation data from Long Beach Airport and the Alamitos Barrier Injection Project Map, and
- Appendix J presents the regulatory agency comments and responses.

Section 2
REMEDY PERFORMANCE

Implementation of an EISB system at IRP Site 70 began in November 2008 after the conclusion of baseline groundwater monitoring activities for treatment of DNAPL and dissolved phase chlorinated solvent plumes. The 2009 and 2010 PMRs document the EISB remediation activities that were completed at the SATG, SAB, FSB-1, FSB-2, SHB-1, SHB-3, and SSB-1 (Figure 1-1; Table 1-5; Insight 2010, 2011). This report documents the activities associated with two performance monitoring events: July/August 2011 and October/November 2011, herein referred to as Summer and Fall 2011 monitoring events, respectively. The EISB remediation activities were conducted in accordance with the technical and functional requirements specified in the RAWP (ECC/Geosyntec 2008a). Field activities are being performed as established in the SOPs contained in Attachment B-2 of the SAP and the SAP Addendum (AIS-TN&A 2011). Variances to the monitoring schedule are discussed in Section 4.

Per the Remedial Design and RAWP (Geosyntec 2006b; ECC/Geosyntec 2008a), a monitoring program has been established to track the progress towards achieving the following performance criteria for the EISB remedy:

- Complete dechlorination of TCE to ethene within the biobarriers;
- Dhc growth to concentrations exceeding 10^7 cells per liter (cells/L) and migration of augmented culture throughout active treatment zones; and
- Localized and/or minimal secondary groundwater quality impacts.

Baseline monitoring was conducted for all biobarriers in August 2008. The biobarriers were installed during 2009 and 2010 and subsequently monitored. Wells upgradient, within and downgradient of the biobarrier were sampled and COC concentrations measured. Table 1-5 summarizes the biobarrier well installation dates and schedule of monitoring for each biobarrier since November 2008.

In order for complete reductive dechlorination to occur, three primary factors are required. First, the oxidation-reduction (redox) state of the aquifer must be sufficiently reducing to support the microbial community required for reductive dechlorination (e.g., dechlorinating and fermenting communities). Second, an adequate supply of electron donor must be present to maintain the reducing redox condition of the aquifer as well as provide the dechlorinating population with its preferred electron donor (i.e., molecular hydrogen). Third, an active Dhc community must be present. These primary factors are captured in the first two performance metrics. The last performance criterion is established to monitor, assess, and minimize the impact of the EISB system on secondary groundwater quality. Impacts to pH and generation of methane and hydrogen sulfide gas can influence the performance of the biobarriers as well as represent potential health and safety risks.

The groundwater monitoring program incorporates various analyses to provide the information necessary to evaluate progress towards achieving the performance criteria listed above. Performance indicators including changes in levels of VOCs, DHGs, inorganic anions, and polymerase chain reaction (PCR) assays specific to Dhc, and aquifer pH are monitored to evaluate performance and track progress toward achieving remedial goals. In addition, surrogate measures of EVO through TOC and volatile fatty acids (acetic, butyric, lactic, and propionic acids) are taken to assess the presence of the electron donor. Field measurements of groundwater elevation are being performed to optimize injection and extraction flow rates during installation of the barriers, to ensure that the barriers are not impacting the direction of groundwater flow, and to better understand and evaluate the meaning of the performance indicators discussed above.

Determining the redox state of the aquifer in the vicinity of each biobarrier is of particular importance since reductive dechlorination of the chlorinated COCs by Dhc occurs best when the environment is highly reducing. The redox state of the aquifer is best evaluated using an approach that incorporates multiple lines of evidence. Various parameters including ORP, DO, nitrate, ferrous iron, sulfate, and methane are monitored. Mildly reducing environments are anaerobic (i.e., DO is near zero) as heterotrophic bacteria utilize the oxygen in the aquifer. Other biogeochemical processes occur, which convert nitrate to nitrite, insoluble ferric iron to soluble ferrous iron, sulfate to sulfide, and carbon dioxide to methane. Hence, in addition to measuring ORP, reduction of the concentrations of DO, nitrate, and sulfate, and increases in the production of ferrous iron and methane concentrations are evaluated. This multiple lines of evidence approach provides a proper representation of the aquifer's redox potential.

In the following subsections, the groundwater quality for each biobarrier is discussed in terms of the above-mentioned performance metrics. Specifically, the state of aquifer geochemistry is presented and compared to conditions necessary to support reductive dechlorination. These conditions include the qualitative measurement of EVO and PCR assays specific to Dhc. The changes in COC concentrations that have resulted after the barriers were installed and the impacts of the biobarriers on the secondary groundwater quality are also discussed (Figures 2-1 through 2-26).

2.1 GROUNDWATER FLOW AND DIRECTION

In 2011, groundwater levels were measured during two events in July (74 wells) and October 2011 (76 wells) (Table 2-1). Groundwater flow and direction were similar in the two monitoring events in 2011. The horizontal hydraulic gradient and flow direction were determined for each of the five defined hydrostratigraphic units: Upper Fines, First Sand, Shell Horizon, Second Sand, and Deep Sand. Water level elevation contour maps that denote these gradients and flow direction for each of the units are depicted in Figures 2-1 through 2-12.

Potential external factors that may influence local horizontal and vertical gradients and groundwater flow direction include the groundwater pumping (regional and agricultural water supply wells) and aquifer recharge (e.g., Alamitos Injection Barrier) activities. Groundwater pumping and aquifer recharge in the Orange County Groundwater Basin causes significant temporal fluctuations in the local groundwater elevations (Geosyntec 2006). Specifically, variability in the groundwater behavior at IRP Site 70 may be caused by changes in operation of the Alamitos Injection Barrier. The Alamitos Injection Barrier, located to the northwest of IRP Site 70 (Appendix I), is operated jointly by Los Angeles County Department of Public Works, the Water Replenishment District of Southern California, and the Orange County Water District (OCWD) as a hydraulic barrier to seawater intrusion. This barrier includes the injection of fresh water at depths as shallow as 27 ft bgs (Geosyntec 2006b). The closest injection well is approximately 2,000 feet northwest of IRP Site 70.

OCWD well production data from municipal and agricultural wells located within a 2-mile radius of IRP Site 70 were reviewed to determine the possible influence of production wells on IRP Site 70 water levels (Appendix I). The OCWD also completed nested monitoring wells at NAVWPNSTA which are further discussed in Section 5. In addition, precipitation data from 2011 for the Long Beach airport was reviewed to determine the influence of precipitation on the water levels and is presented in Appendix I. Water levels have generally risen between 2 to 12 feet in most wells since 2010 (Figures 2-11 and 2-12). One of the influences may be higher than normal rain fall in WY 2011. The annual precipitation totals for WY 2011 was 18.79 inches for the Long Beach area, compared to 15.66 inches in WY 2010 and 9.44 inches in WY 2009 (Insight 2009a, 2010, and 2011).

2.1.1 UPPER FINES GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in thirteen Upper Fines monitoring wells in both the July and October 2011 monitoring events. The Upper Fines is the shallowest hydrostratigraphic unit defined from ground surface to approximately 60 ft bgs (Tables 1-2 and 2-1; Figures 2-1 and 2-2).

Groundwater elevations in the Upper Fine wells measured in October 2011 are generally consistent with data obtain from the same wells gauged in July 2011. In July 2011, groundwater elevations in the Upper Fines monitoring wells ranged from -1.47 (MW-70-03) to -0.16 ft MSL (MW-70-22). In October 2011, groundwater elevations in the Upper Fines monitoring wells ranged from -1.58 (MW-70-03) to 0.05 ft MSL (MW-70-22). In July 2011, depth to water ranged from 5.85 (MW-70-17) to 10.41 ft bgs (MW-70-10). In October 2011, depth to water ranged from 6.03 (MW-70-17) to 10.73 ft bgs (MW-70-10). Comparison of Fall 2011 and 2010 water levels, generally suggests that water levels have risen in the Upper Fines approximately 1.69 (MW-70-22) to 7.48 ft (MW-70-28) (Table 2-1; Figures 2-1, 2-2 and 2-11). The increase in water levels within this year is primarily attributed to the rainfall increase during this period and reduction in agricultural pumping (Appendix I).

The direction of groundwater flow in the Source Area in both July and October 2011 was to the south/southwest towards a groundwater "low" and northwest in the vicinity of the Source Area Treatment wells. Comparison of historical data shows similar patterns (BEI 2006). Horizontal hydraulic gradients in the Upper Fines Unit ranged from approximately 0.0003 foot per foot (ft/ft), in the area southeast of Kitts Highway to 0.001 ft/ft in the area northwest of Kitts Highway (Figures 2-1 and 2-2).

The variable groundwater direction and horizontal hydraulic gradients observed in the Upper Fines Unit is consistent with previous investigations to date. An old stream drainage system may be traced from the area due north of IRP Site 70, north of Westminster Boulevard, trending southwest through the current location of IRP Site 70, subparallel to the current drainage channel that ultimately flows into Anaheim Bay (BEI 2006). The old drainage system is currently covered with structures at IRP Site 70. Previous investigations attribute the variable direction and gradients in the shallowest zone to the presence of the old drainage system (BEI 2006). In addition, a review of the OCWD municipal and agricultural data suggests that injection wells in the area west of IRP Site 70, part of the Alamitos Injection Barrier Project, may be influencing the water levels in the shallowest Upper Fines Unit (Appendix I).

2.1.2 FIRST SAND GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in thirty-three First Sand monitoring wells in both the July and October 2011 monitoring events. The First Sand hydrostratigraphic unit is defined from approximately 60 to 105 ft bgs. The First Sand monitoring wells are further defined spatially based on their proximity to each of the FSBs: SAB-1, FSB-1, and FSB-2 (Table 2-1; Figures 2-3 and 2-4).

Groundwater elevations in the First Sand monitoring wells measured in October 2011 are generally consistent with data obtain from the same wells gauged in July 2011. In July 2011, groundwater elevations in the First Sand monitoring wells ranged from -2.69 (MW-70-16) to -0.93 ft MSL (MW-70-POC01). In October 2011, groundwater elevations in the First Sand monitoring wells ranged from -3.60 (MW-70-16) to -1.27 ft MSL (MW-70-POC01). In July 2011, depth to water ranged from 5.30 (MW-70-MNA06) to 13.37 ft (MS-70-43A). In October 2011, depth to water ranged from 5.70 (MW-70-MNA06) to 14.04 ft (MW-70-43A) (Table 2-1). Four First Sand wells (MW-70-PMW07A, MW-70-PMW08A, MW-70-MNA09 and IW-70-FSB216) were not contoured, which is generally consistent with the 2009 baseline monitoring results (Insight 2010). These wells are screened in the shallower portion of the First Sand between 64 and 75 ft bgs, and show higher water level elevations. Comparison of Fall 2011 and 2010 water levels, generally suggests that water levels have risen in the First Sand approximately 7.38 (MW-70-PM03A) to 10.63 ft (MW-70-16) (Table 2-1; Figures 2-1, 2-2 and 2-11). The increase in water levels within this year is primarily attributed to the rainfall increase during this period and reduction in agricultural pumping (Appendix I).

The direction of groundwater flow in the First Sand hydrostratigraphic unit in July and October 2011 was to the south/southeast, consistent with previous monitoring results (BEI 2006; Insight 2009a, 2010, and 2011). Horizontal hydraulic gradients in the First Sand ranged from 0.001 to 0.002 ft/ft. The upward vertical gradient between the Shell Horizon and First Sand Unit in the area of MW-70-MNA12 is also consistent with previous groundwater monitoring results (BEI 2006; Insight 2009a, 2010, and 2011).

2.1.3 SHELL HORIZON GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in twelve Shell Horizon monitoring wells on both the July and October 2011 monitoring events. The Shell Horizon hydrostratigraphic unit is defined from approximately 105 to 135 ft bgs. The Shell Horizon monitoring wells are further defined spatially based on their proximity to each of the Shell Horizon Biobarriers: SHB-1 and SHB-3 (Table 2-1, Figures 2-5 and 2-6).

Groundwater elevations in the Upper Fine wells measured in October 2011 are generally consistent with data obtain from the same wells gauged in July 2011. In July 2011, groundwater elevations in the Shell Horizon monitoring wells ranged from -1.93 (MW-70-PMW09) to -2.95 ft MSL (MW-70-23). In October 2011, groundwater elevations in the Shell Horizon monitoring wells ranged from -2.53 (MW-70-PMW09) to -3.68 ft MSL (MW-70-23). In July 2011, depth to water ranged from 8.61 ft (MW-70-PMW10) to 14.12 ft (MW-70-23). In October 2011, depth to water ranged from 9.26 ft (MW-70-PMW10) to 14.85 ft (MW-70-23) (Table 2-1, Figures 2-5 and 2-6). Water levels were not contoured in IW-70-SHB310, due to the presence of vegetable oil during the July and October 2011 monitoring. Comparison of Fall 2011 and 2010 water levels (excluding IW-70-SHB310), generally suggests that water levels have risen in the Shell Horizon approximately 9.75 (IW-70-SHB113) to 11.47 ft (MW-70-MNA14) (Table 2-1; Figures 2-5, 2-6 and 2-12). The increase in water levels within this year is primarily attributed to the rainfall increase during this period and reduction in agricultural pumping (Appendix I).

The direction of groundwater flow in the Shell Horizon hydrostratigraphic unit in July and October 2011 was to the southeast, consistent with previous monitoring results (Insight 2009a, 2010, and 2011). The horizontal hydraulic gradient in the Shell Horizon was approximately 0.001 ft/ft (Figures 2-5 and 2-6).

2.1.4 SECOND SAND GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in fourteen Second Sand monitoring wells in both the July and October 2011 monitoring events. The Second Sand hydrostratigraphic unit is defined from approximately 135 to 170 ft bgs. The Second Sand monitoring wells are further defined spatially based on their proximity to the Second Sand Biobarrier: SSB-1 (Table 2-1, Figures 2-7 and 2-8).

Groundwater elevations in the First Sand monitoring wells measured in October 2011 are generally consistent with data obtain from the same wells gauged in July 2011. In July 2011,

groundwater elevations in the Second Sand monitoring wells ranged from -1.33 (MW-70-PMW14A) to -3.90 ft below MSL (MW-70-21). In October 2011, groundwater elevations in the Second Sand monitoring wells ranged from -2.13 (MW-70-PMW14A) to -4.65 ft below MSL (MW-70-21). In October 2011, groundwater elevations in the Second Sand monitoring wells ranged from -2.13 (MW-70-PMW14A) to -4.65 ft below MSL (MW-70-21). In July 2011, depth to water ranged from 7.92 ft bgs (MW-70-MNA15) to 13.21 ft bgs (MW-70-14) In October 2011, depth to water ranged from 8.65 ft bgs (MW-70-MNA15) to 13.85 ft bgs (MW-70-43B and MW-70-14) (Table 2-1, Figures 2-7 and 2-8). The following wells were not contoured: MW-70-43B, MW-70-MNA15, MW-70-MNA17, and IW-70-SSB109 (Table 2-1, Figures 2-7 and 2-8). The differences in the elevations in these wells may be due to a combination of local lithologic differences in the Second Sand as well as some differences in screen intervals. Well MW-70-43B is screened slightly shallower between 136 to 146 ft bgs. Wells MW-70-MNA15 and MW-70-MNA17 are screened between 140 and 150 feet bgs. IW-70-SSB109 is screened over a greater interval, between 126 to 166 ft bgs. The differences in elevation in 2009, 2010, and 2011 may be due to localized effects from the injection and therefore, these wells were not included in the contours in this report. Depth to groundwater in Second Sand wells in October 2011 generally decreased approximately 0.8 feet when compared to July 2011.

Comparison of Fall 2011 and 2010 water levels, generally suggests that water levels have risen in the Second Sand approximately 9.93 (MW-70-36) to 11.75 ft (MW-70-21) (Table 2-1; Figures 2-7, 2-8 and 2-12). The increase in water levels within this year is primarily attributed to the rainfall increase during this period and reduction in agricultural pumping (Appendix I).

The direction of groundwater flow in the Second Sand hydrostratigraphic unit in July and October 2011 was to the southeast, consistent with previous monitoring results (BEI 2006; Insight 2009a, 2010, and 2011). The addition of the new Second Sand well MW-70-49 provided additional data during the October 2011 monitoring event, northeast of SSB1. The horizontal hydraulic gradient in the Second Sand was approximately 0.001 to 0.003 ft/ft (Figures 2-7 and 2-8).

2.1.5 DEEP SAND GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in three Deep Sand POC wells in both the July and October 2011 monitoring events. The Deep Sand hydrostratigraphic unit is defined as depths greater than 190 ft bgs (Table 2-1; Figures 2-9 and 2-10).

Groundwater elevations in the First Sand monitoring wells measured in October 2011 are generally consistent with data obtain from the same wells gauged in July 2011. In October 2011, groundwater elevations in the Deep Sand POC wells ranged from -0.61 ft (MW-70-POC03) to -4.44 (MW-70-POC04) ft MSL. In October 2011, groundwater elevations in the Deep Sand POC wells ranged from -2.66 ft (MW-70-POC03) to -5.63 (MW-70-POC04) ft MSL. In July 2011, depth to water ranged from 12.30 (MW-70-POC03) to 14.13 ft bgs (MW-70-POC04). In

October 2011, depth to water ranged from 10.25 (MW-70-POC03) to 12.94 ft bgs (MW-70-POC04).

Comparison of Fall 2011 and 2010 water levels, generally suggests that water levels have risen in the Deep Sand approximately 10.04 (MW-70-PM03A) to 13.11 ft (MW-70-16) (Table 2-1; Figures 2-9, 2-10 and 2-12). The increase in water levels within this year is primarily attributed to the rainfall increase during this period and reduction in agricultural pumping (Appendix I).

The direction of groundwater flow in the Deep Sand hydrostratigraphic unit in October 2011 was to the southeast, consistent with July 2011 monitoring. The horizontal hydraulic gradient in the Deep Sand in July and October 2011 was approximately 0.002 ft/ft (Figures 2-9 and 2-10).

2.1.6 SUMMARY OF GROUNDWATER FLOW AND DIRECTION

Hydraulic directions and gradients in the hydrostratigraphic units have been generally consistent with previous investigations (BEI 2006; Geosyntec 2006b; Insight 2009a, 2010, and 2011). Groundwater elevations in October 2011 ranged from -5.63 ft MSL in Deep Sand POC well MW-70-POC04 to 0.05 ft MSL in Upper Fines POC well MW-70-22. Horizontal hydraulic gradients across IRP Site 70 ranged from 0.0003 to 0.002 ft/ft.

Groundwater elevations measured in October 2011 are generally consistent with data obtain from the same wells gauged in July 2011. Comparison of Fall 2011 and 2010 water levels, generally suggests that water levels have risen in all hydrostratigraphic zones. The increase in water levels within this year is primarily attributed to the rainfall increase during this period and reduction in agricultural pumping (Appendix I). The vertical head difference between hydrogeologic units indicates generally downward vertical gradients of groundwater flow throughout the plume and source areas between the Upper Fines, First Sand, Shell Horizons, Second Sand and Deep zones. This is consistent with previous observations (Geosyntec 2006b; Insight 2009a, 2010, and 2011).

2.2 GROUNDWATER QUALITY AND REMEDY PERFORMANCE

Groundwater samples were collected during two events in Summer 2011 and Fall 2011. The Summer 2011 groundwater sampling event consisted of collection of groundwater samples from 48 monitoring wells. The Fall 2011 groundwater sampling event consisted of collection of groundwater samples from 80 groundwater monitoring wells (Table 1-1). These wells were selected to monitor the performance of the EISB activities conducted in the biobarriers, upgradient and downgradient of the biobarriers, and in the POC wells. Groundwater quality parameters, which consisted of DO, ORP, pH, sulfate, and alkalinity, VOCs, TOC, VFAs, DHGs, and chlorinated ethenes were monitored per the schedule outlined in Table 1-1.

2.2.1 CONCENTRATIONS OF CHLORINATED ETHENES

The concentrations of chlorinated ethenes and ethene itself serve as direct evidence of degradation of VOCs. The concentrations of donor and redox conditions are indicative of whether conditions are favorable for reductive dechlorination to progress at a site. Figures 2-13

through 2-19 show CVOC molar concentration trends for each of the biobarriers. Two-dimensional concentration maps for the COCs are documented in Figures 2-27 through 2-38. Three-dimensional CSM visualizations showing the VOC concentration trends are presented in Section 3. The projected extent of TCE at 250 µg/L in 2008 and 2011 demonstrate the significant reduction of TCE concentrations across all hydrogeologic zones (Figures 2-40 and 2-41).

The performance of the SATG and the 6 biobarriers (SAB, FSB-1, FSB-2, SHB-1, SHB-3, and SSB-1) is discussed below based on changes in molar concentrations of chlorinated ethenes. Chlorinated ethene concentrations are presented as molar concentrations because reductive dechlorination is a 1 to 1 stoichiometric conversion (i.e., for each mole of TCE degraded, one mole of dichloroethene (DCE) is produced). Graphs displaying the total molar concentrations of TCE, DCE, VC, and ethene are presented in 2-13 through 2-19.

In general, within the biobarrier wells, the TCE present during baseline was converted to cis-DCE soon after installation of the biobarrier, and continued conversion to VC and ethene has been observed during the Fall 2011 performance monitoring event. In general, emulsified oil injections have created conditions conducive to reductive dechlorination in all the biobarriers and bioaugmentation appears to have been successful for establishing dechlorinating populations in the treatment areas. This is evidenced by the fact that most injection wells sampled during the 2011 monitoring events, as well as many of the performance monitoring wells located downgradient of the barriers, have shown increases in reductive daughter products VC and ethene, and decreases in TCE.

The following bullets summarize data and observations associated with each biobarrier:

- Within the SATG, where injections occurred between May and August 2010, the transformation of TCE to cis-DCE, VC, and ethene soon after treatment indicates that dechlorination is occurring in the Source Area (MW-70-PMW01A, MW-70-PMW01B, MW-70-28) (Figure 2-13). Increased concentration of TCE and cis-DCE in upgradient MW-70-MNA01 may be indicative of presence of DNAPL still present in the Source Area. The presence of increased concentrations of ethene and methane dissolved gases is also indicative that transformation is occurring as designed.
- Within the SAB, where injections occurred between November 2008 and January 2009 (the first Biobarrier that was installed), the presence of VC and low concentrations of ethene in IW-70-SAB06 and IW-70-SAB11, indicates that transformation is still occurring (Figure 2-14 and Appendix G). Increased concentrations of cis-DCE in the deeper upgradient performance monitoring well MW-70-PMW02B indicates that partial degradation is occurring upgradient of the SAB, and that contaminants are still migrating toward the SAB from the source area. The fact that the TCE is being converted to cis-DCE and VC shows that the SAB is stimulating partial degradation.
- Within FSB-1, where injections occurred between December 2009 and February 2010, the presence of VC but low concentrations of ethene, in IW-70-FSB108 and IW-70-FSB118, indicates that although transformation is occurring within the biobarrier, it may be occurring at a slower rate within FSB-1 (Figure 2-15). In addition, increased concentrations of cis-DCE and VC

in downgradient well MW-70-38 and performance monitoring well MW-70-MNA08 are indicative that transformation may be occurring outside of the areas immediately adjacent to the injection wells and upto a distance of 200 feet from the injection locations (Figure 2-15). The highest concentration of TCE at 3,900 µg/L reported in MW-70-PMW06B, upgradient of the FSB-1 biobarrier, combined with cis-DCE concentrations above 500 µg/L in upgradient FSB-1 performance monitoring wells (MW-70-PMW04A, MW-70-PMW-04B, MW-70-PMW06A, MW-70-PMW06B), suggest that higher concentration of TCE is migrating towards the biobarrier and is being dechlorinated.

- Within FSB-2, where injections occurred between October and November 2009, the presence of VC and low ethene concentrations in IW-70-FSB216 indicates that transformation is occurring (Figure 2-16). Increased concentrations of cis-DCE and VC in downgradient wells, MW-70-PMW08A, MW-70-PMW08B, MW-70-MNA12 and MW-70-MNA10, are indicative that transformation is occurring outside of the areas immediately adjacent to the injection wells, to a distance of approximately 500 feet (Figure 2-16). Increased concentration of cis-DCE in deeper upgradient well MW-70-PMW-07B, indicates that dechlorination is occurring upgradient of FSB-2.
- Within SHB-1, where injections occurred between February and March 2010, the presence of VC and ethene concentrations in IW-70-SHB113 indicate that dechlorination is occurring within SHB-1. Increased concentrations of cis-DCE, stable VC and ethene concentrations in upgradient (MW-70-PMW09) and downgradient well (MW-70-PMW10) indicates that dechlorination is occurring outside areas immediately adjacent to the injection wells but may be occurring at a slower rate and not transforming completely to ethene (Figure 2-17).
- Within SHB-3, where injections occurred between March and September 2009, the presence of cis-DCE and VC in IW-70-SHB310 and IW-70-SHB311, indicate that dechlorination is occurring although potentially at a slower rate with minimal changes since 2010. Increased concentrations of VC and ethene in upgradient and downgradient wells indicate that dechlorination is occurring outside areas immediately adjacent to the injection wells (Figure 2-18). The most significant change since 2010 is increased concentration of cis-DCE in MW-70-MNA14, located approximately 350 feet downgradient of SHB-3 indicating transformation is occurring although low concentrations of ethene may be indicative of a slower rate of transformation (Figure 2-18).
- Within SSB-1, where injections were completed between February and March 2009, low concentrations of cis-DCE, VC, and ethene indicate that transformations have slowed within SSB-1. However, increased concentrations of DCE, VC in upgradient (MW-70-PMW13A, MW-70-PMW13B, MW-70-MNA15) and downgradient wells (MW-70-PMW14A, MW-70-PMW14B) are indicative that dechlorination is occurring outside areas immediately adjacent to the injection wells. In addition, increased cis-DCE, VC and ethene concentrations in MW-70-MNA16, are indicative of dechlorination occurring at least 150 feet downgradient of SSB-1.

In general, the performance monitoring wells located upgradient and downgradient of the biobarriers are responding to dechlorination transformation processes and appear to be significantly impacted by the amendments injected into the biobarrier wells. Cis-DCE is the dominant transformation product present in wells during the Fall 2011 monitoring event. The amendments added to the biobarriers appeared to have significant effect on the wells downgradient of the biobarrier, which is anticipated since the EISB amendments and

contaminants of concern will travel downgradient of the barriers in the direction of groundwater flow. These observations are the primary line of evidence that the EISB remedy is functioning as expected.

2.2.2 ELECTRON DONOR CONCENTRATIONS

As part of the performance monitoring activities for 2011, TOC and VFAs were measured as an indication of electron donor presence to determine if sufficient EVO distribution is present in the treatment areas to allow for the continued process of dechlorination at IRP Site 70. TOC and VFAs were measured in select wells upgradient, downgradient and within each biobarrier per the schedule in Table 1-1. Figures 2-20 and 2-21 summarize consistent trends within the representative performance monitoring wells downgradient of each biobarrier. Appendix G depicts TOC trends in all the wells sampled.

Total Organic Carbon

TOC was monitored at all biobarriers during baseline and subsequent performance monitoring events (Tables 2-3 through 2-15; Appendices E and G). Select wells located upgradient, downgradient, and within the biobarriers were sampled to determine the effect of EVO injection (Figures 2-20 and 2-21). During baseline sampling, the TOC concentrations were below 3 milligrams per liter (mg/L) in all of the wells monitored with most TOC concentrations in wells reported below 1 mg/L. In general, after injection of the EVO into the biobarrier wells, the TOC concentrations increased to greater than 100 mg/L at injection wells. Maximum TOC concentrations measured after injection are summarized below based on a comparison of data to date. Figures 2-20 and 2-21, Tables 2-1 through 2-12 and Appendix G summarize the history of TOC performance monitoring results.

Results of the Fall 2011 sampling event indicate that TOC concentrations either decreased or remained at low concentrations in most of the biobarrier wells (Figures 2-20 and 2-21). Decreases in TOC concentration were specifically noted at the SAB, FSB-2, SHB-1, and SSB-1. Reduction of TOC was less in FSB-1 and SHB-3. The SATG was the last area to be installed (August 2010), but TOC in IW-70-SAT35 decreased from 1,220 to 86.2 mg/L between Fall 2010 and Fall 2011. The low TOC concentrations suggest that additional amendment injections may be needed soon. These data may reflect the heterogeneous nature of the aquifer matrix in the different lithologic layers that results in an uneven distribution of the carbon source between the injection wells and the PMWs. TOC concentrations are just one line of evidence used to evaluate whether conditions are suitable for reductive dechlorination at the site. Additionally, COC daughter products, redox conditions, Dhc levels, and VFAs are being monitored to assess the performance of the EISB remedy.

Maximum Total Organic Carbon Concentrations

Lithologic Unit	Bio-barrier	Bio-barrier Completion Date	Well Identification	Initial TOC (Baseline - 2008) (mg/L)	TOC Concentration (mg/L)		
					~ 3 Months after Installation	Fall 2010	Fall 2011
Upper Fines	SATG	08/3/2010	IW-70-SAT16	NM	NM	2,910	NM
	SATG	08/3/2010	IW-70-SAT35	NM	NM	1,220	86.2
	SATG	08/3/2010	MW-70-PMW01A	ND	NM	915	174
First Sand	SAB	01/30/2009	IW-70-SAB06	0.828 J	860	20.5	27.8
			IW-70-SAB11	1.24	616	177	111
First Sand	FSB-1	02/12/2010	IW-70-FSB108	0.656 J	186	106	129
	FSB-2	11/24/2009	IW-70-FSB216	1.68	468	468	70.5
Shell Horizon	SHB-1	4/7/2010	IW-70-SHB113	1.03	140	110	4.06
	SHB-3	09/25/2009	IW-70-SHB310	1.8	769	2,080	1670
Second Sand	SSB-1	03/18/2009	IW-70-SSB109	1.28	1,110	121	96.3

Notes:

J – estimated value
mg/L – milligrams per liter
NM – not measured
ND – not detected

Volatile Fatty Acids

VFAs were monitored in select biobarrier wells and wells upgradient and downgradient of the biobarrier (Figure 2-22; Tables 2-2 through 2-13). Monitoring VFAs helps to determine the distribution and consumption of EVO in the biobarrier and aquifer. In general, VFAs (particularly acetate and propionate) spiked directly after EVO injections in the injection wells and some performance monitoring wells (Insight 2011, Figure 2-22). During subsequent monitoring events, the concentration of the VFAs decreased, indicating that they were being consumed by microbes in the biobarrier. In 2011, concentrations of VFA in groundwater at the injection wells were below detection limits for almost all injection wells except for IW-70-SAT35 (SATG). In general, the concentration of VFAs in the PMWs remained below or at detection limits with one exception. In the SATG MW-70-PMW01A, VFA (acetate) spiked to 845 mg/L and then dropped to less than 100 mg/L but rebounded in Fall 2011 to 327 mg/L (Table 2-2, Figure 2-22). As noted above, concentrations of VFAs are one line of evidence to assess the suitability of the aquifer to support active reductive dechlorination. These data

indicate that EVO is being consumed by the fermenting population and utilized by anaerobic populations such as methanogens and dechlorinators.

2.2.3 REDOX CONDITIONS

This section discusses DO-ORP and Sulfate-Methane trends in the IRP Site 70 SATG and six biobarriers in Fall 2011.

DO-ORP Trends

For reductive dechlorination to work effectively (i.e., complete transformation of TCE to ethene) DO levels must be below 1 mg/L. Within all of the biobarriers, the DO concentrations were below 1 mg/L during the 2011 performance monitoring event, except for IW-70-SHB310 in the SHB-3 biobarrier. Although the DO is below 1 mg/L, most DO concentrations were above 0 mg/L, suggesting slightly increasing trends (Table 2-2; Figure 2-23; Appendices E and G).

ORP readings are significant in determining the geochemical condition of the aquifer. In order for Dhc to survive and grow aquifer conditions should be at least in the methanogenic range, which requires the ORP to be between -100 and -300 millivolts (mV) or lower. ORP readings collected during the 2011 monitoring events indicated that all of the upgradient and downgradient PMWs and biobarrier wells were within this range. In a few instances ORP values in Fall 2011 were below -300 mV in FSB-2 (MW-70-PMW07A and MW-70-PMW08A), indicating very favorable conditions for reductive dechlorination of TCE and its daughter products (Table 2-2; Figure 2-23; Appendices E and G). A slight increasing trend of ORP is observed for performance monitoring wells in biobarriers SATG, SAB, and FSB-1 (Table 2-2; Figure 2-23; Appendices E and G).

Sulfate-Methane Trends

A review of sulfate and methane trends are another of the multiple lines of evidence for determining whether favorable conditions exist for dechlorination. Specifically, low sulfate concentrations (or at least concentrations significantly reduced from pre-EISB concentrations) and high methane concentrations indicate that methanogenic redox conditions have been established, which are most favorable for dechlorination. Although there is some variation within each biobarrier, generally sulfate concentrations were reduced shortly after initial injections, but have been increasing in the SATG, SAB, FSB-1, SHB-3, and SSB-1. In these biobarriers (SATG, SAB, FSB-1, SHB-3, and SSB-1), methane concentrations have generally been decreasing, indicating a reduction in methanogenesis in these biobarriers. One exception in the SAB is MW-70-PMW03B, where methane concentrations have increased slightly while sulfate concentrations have remained stable. A review of the performance monitoring wells in biobarriers FSB-2 and SHB-1 shows a little more variability in sulfate-methane trends. In FSB-2 performance monitoring well MW-70-PMW08A, sulfate concentrations are decreasing and methane concentrations are increasing but in performance monitoring well MW-70-PMW08B,

the opposite trend is observed. In SHB-1, sulfate concentrations are relatively stable in MW-70-PMW10 and there is a slight rise in methane concentrations but methane concentrations are generally low (Tables 2-3 through 2-15; Figure 2-24; Appendices E and G).

2.2.4 DEHALOCOCCOIDES DISTRIBUTION AND SURVIVABILITY

During installation of the biobarriers, a culture of KB-1® was injected into the biobarrier wells. One of the important lines of evidence indicating that the EISB remedy is functioning as designed is to confirm high concentrations of Dhc and the presence of the *vcr*A gene. The expression of the *vcr*A gene by the dechlorinating population has been correlated to complete reductive dechlorination. The expression (or up regulation) of the *vcr*A gene is being used to monitor the performance of the remedy and ensure that cis-DCE and VC stall does not occur.

The concentrations of Dhc and *vcr*A were monitored in performance monitoring wells located downgradient of the biobarriers and in select biobarrier wells. In general, injection and performance monitoring wells where Dhc and *vcr*A concentrations were within or sometimes above the moderate range (10^4 to 10^7 cells/L) of concentrations in the SATG, SAB, FSB-1 and FSB-2 biobarriers (Figure 2-25). However, *vcr*A and Dhc concentrations were more variable and primarily below the lower limit of the moderate concentration range (10^4 to 10^7 cells/L) in some of the downgradient performance monitoring wells in SHB-1 (MW-70-PMW10), SHB-3 (PMW-12A) and SSB-1 (MW-70-PMW14B) (Figure 2-26). In the SHB-3, the deeper performance monitoring well, MW-70-PMW12B, had reported Dhc and *vcr*A concentrations in the moderate range. In SSB-1, Dhc was reported in moderate concentration in the deeper performance monitoring well, MW-70-PMW14B, but *vcr*A was reported below laboratory detection limits.

In general, the *vcr*A in the moderate range correlates to some production of VC and ethene. If Dhc concentrations were high but *vcr*A concentrations low, cis-DCE persisted.

2.2.5 WATER QUALITY PARAMETERS

This section describes any trends in general water quality parameters.

During the 2011 Performance monitoring event, pH values generally ranged from approximately 6 to 8 within the biobarriers, the range ideal for microbial growth. There were however a few outliers which were primarily located outside the biobarrier. The highest pH was reported in newly reconstructed well RDO-04 at 10.56. This well was developed prior to sampling, and additional sampling in the future may need to confirm whether this is a consistent pH trend in RDO-04. In addition, a pH of 4.88 was reported in MW-70-MNA03 (upper fines hydrogeologic unit) and the second highest pH was reported at 9.30 in MW-70-43A (First Sand hydrogeologic unit). These values probably reflect the general groundwater geochemistry. High pH values have been previously reported in MW-70-43A. Potentially, the low pH in MW-70-MNA03 may be attributable to production of hydrochloric acid as chlorinated ethenes degrade. Alkalinity is an indicator of the buffering capacity of the aquifer. A strong buffering capacity is important

because as the EVO is used by the microorganisms, it produces VFAs that have the potential to reduce the pH of the aquifer, in addition to the potential production of hydrochloric acid. In general, in the SATG area, the alkalinity (>700 mg/L in the SATG) is higher than in the other treatment biobarriers. Alkalinity values were consistent with the 2010 and 2009 performance monitoring data.

2.3 SOIL VAPOR RESULTS

Twelve soil vapor probes were installed at the locations shown in Figure 1-3 as part of the baseline monitoring performed in 2008, in order to monitor methane and hydrogen sulfide gases within the vadose zone soils (Insight 2009a). The twelve soil vapor probes are constructed within the vadose zone at depths between 5 and 6 ft bgs. These locations were chosen to correspond with areas present near active buildings or underground utility corridors containing potentially high concentrations of electron donor. The probes were installed around the source area and downgradient to monitor for migration of these gases as required by the RAWP (ECC/Geosyntec 2008a). Monitoring of these gases over the course of the RA at IRP Site 70 is important for the protection of onsite workers, including those engaged in the RA as well as the many tenants/occupants of the surrounding facilities.

During the 2011 performance monitoring, soil gas samples were collected from the 12 soil vapor probes, and were analyzed for methane and hydrogen sulfide gases. The analytical results are shown in Table 2-15 and Figure 2-39 and discussed in further detail below.

2.3.1 METHANE SOIL VAPOR RESULTS

Methane was reported in all samples and ranged from 2.0 parts per million by volume (ppmV) at SV-70-05 (southwest of Building 118) to 700,000 ppmV at SV-70-10 (west of Building 123). The lower explosive limit (LEL) for methane in air is 5 percent (or 50,000 ppmV) while the upper explosive limit (UEL) in air is 15 percent (or 150,000 ppmV). Methane was reported in one sample (SV-70-10) at concentrations above the UEL and in one sample (SV-70-09) at a concentration between the UEL and the LEL. In general, compared to the 2010 soil vapor sampling event, the methane concentrations have decreased in nine soil vapor probes (SV-70-01 through SV-70-08, and SV-70-12) and increased in three soil vapor probes (SV-70-09 through SV-70-11) during the 2011 soil vapor sampling event. The highest concentration of methane reported during the 2011 sampling event (SV-70-10) was measured in sample collected from location immediately adjacent to the SAB well IW-70-SAB14.

2.3.2 HYDROGEN SULFIDE SOIL VAPOR RESULTS

Hydrogen sulfide was not detected above the laboratory reporting limit of 1.0 ppmV in all twelve soil vapor samples (SV-70-01 through SV-70-12) collected during the 2011 sampling event.

2.3.3 AMBIENT AIR MONITORING FOR METHANE GAS

A Methane Monitoring Plan with emergency procedures was prepared in January 2009 (Insight 2009c) for implementation after elevated concentrations of methane were detected in the

vapor sample collected from the 12 soil vapor probes during the 2008 base line sampling activities. The purpose of this Methane Monitoring Plan is to monitor and document methane levels within utility corridors and buildings where methane concentrations could accumulate in air above the LEL. As part of this plan, selected locations throughout the RT&E Area were monitored weekly for the first two months of the EISB activities, and monthly thereafter. Monitoring locations were selected based on analytical results from soil gas probes installed within the vadose zone soils and the proximity of the probes to nearby utility corridors, buildings, and groundwater wells. The following locations were monitored periodically for methane gas in the RT&E area:

- Inside Buildings 118, 119, 121, 122, 123 (north and south), and 124.
- In the vicinity of utility corridors west of the tank farm and east of soil gas probes SV-70-02 and SV-70-05.

The periodic methane gas monitoring throughout the RT&E Areas is ongoing. The most recent ambient air monitoring event for methane gas was conducted at selected locations throughout the RT&E Area (outdoor areas, inside Buildings 118, 119, 121, 122, 123, 124, and utility corridors west of the tank farm and east of soil gas probes SV-70-02 and SV-70-05 on February 2, 2012. A hand-held multi-gas meter (RKI Eagle), equipped with methane and oxygen sensors, was used to monitor for the presence of explosive vapors and oxygen levels within the selected areas. Inside buildings, readings were taken within the breathing zone and at or near surface features (e.g., cracks, joints, penetrations, subsurface utility accesses) in the floor slab that could serve as potential pathways for the infiltration of methane gas from the underlying soils or through connecting subsurface utility chases. Stagnant areas where methane gas could potentially accumulate were also monitored. Readings were recorded on a map of the building. In outdoor areas, readings were taken in and around access openings to utility corridors and groundwater well boxes, and at or near cracks in the asphalt and/or other surface features that could serve as migration pathways for methane gas. Readings were recorded on an area map.

Logs that documented the February 2, 2012 monitoring event results are presented in Appendix A. Methane gas was not detected in the ambient air within the breathing zone either inside the buildings or in outdoor areas of the locations monitored to date in the RT&E area.

2.3.4 MEASURES TAKEN TO PROTECT ONSITE WORKERS

The following precautionary measures were instituted to protect onsite workers from the effects of methane gas production during RA at IRP Site 70.

- Instituted a methane monitoring program to monitor and document methane levels within utility corridors and buildings where methane concentrations could accumulate in air above the LEL.
- Notified building tenants/occupants of the potential methane intrusion.
- Posted warning signs throughout the area and on entrances to utility corridors to warn of the potential presence of flammable vapors.

- Posted no smoking and no parking signs in areas that could potentially present an explosive hazard.
- Designated specific smoking areas that are well outside areas of potential explosive hazard.

2.3.5 SUMMARY OF SOIL VAPOR RESULTS

The highest concentration of methane reported in the soil gas sample SV-70-10 is located immediately adjacent to the SAB injection well IW-70-SAB14. Concentrations measured in the vicinity of the SAB wells ranged from 6,800 ppmV to 700,000 ppmV, which is an indication that methanogenesis is occurring in the SAB.

Continued production of methane during EISB and subsequent mixing with air can produce concentrations within the explosive range. Migration from the vadose zone soils to the surface through cracks in the asphalt and/or to nearby utility corridors through preferential pathways in the subsurface is a potential hazard. However, a methane monitoring plan has been put in place to ensure that onsite workers are protected. In addition, air monitoring for VOCs in these areas will be implemented as part of the monitoring plan.

2.4 PERFORMANCE REMEDY SUMMARY

The following multiple lines of evidence from the 2011 performance monitoring are summarized:

1. The presence of TCE in the Source Area at 2,800 µg/L and a maximum site-wide TCE concentration of 3,900 µg/L in MW-70-PMW06B, upgradient of FSB-1, indicates that an ongoing source of TCE is present.
2. A significant reduction of total moles of all COCs is observed in all hydrogeologic zones since active remediation began. The 2011 performance monitoring data suggest that degradation rates have slowed in all biobarriers. The primary transformation product is cis-DCE.
3. Electron donor concentrations were measured as TOC and VFA's in select wells. TOC concentrations decreased in the SAB, FSB-2, SHB-1, and SSB-1. In 2011, groundwater VFA results for the injection wells were non-detect for almost all injection wells except for IW-70-SAT35 (SATG). In general, the concentration of VFAs in the PMWs remained below or at detection limits with one exception. These data indicate that EVO is being consumed by the fermenting population and utilized by anaerobic populations such as methanogens and dechlorinators.
4. In biobarriers SATG, SAB, FSB-1, SHB-3, and SSB-1, sulfate has been increasing and methane concentrations have generally been decreasing, indicating a reduction in methanogenesis in these biobarriers. A review of the performance monitoring wells in biobarriers FSB-2 and SHB-1 shows somewhat more variability.
5. Within all of the biobarriers, the DO concentrations were below 1 mg/L during the 2011 Performance monitoring event, except for IW-70-SHB310 in the SHB-3 biobarrier. ORP readings collected during the 2011 monitoring events indicated that all of the upgradient and downgradient PMWs and biobarrier wells were within the range

of -100 and -300 mV. There is a slight increasing trend of ORP reported in performance monitoring wells in biobarriers SATG, SAB, and FSB-1.

6. In the SATG, SAB, FSB-1 and FSB-2 biobarriers, in general, Dhc and *vcr*A concentrations were within or sometimes above the moderate range (10^4 to 10^7 cells/L) of concentrations. However, *vcr*A and Dhc concentrations were more variable and primarily below the lower limit of the moderate concentration range (10^4 to 10^7 cells/L) in some of the downgradient performance monitoring wells in SHB-1 (MW-70-PMW10), SHB-3 (PMW-12A) and SSB-1 (MW-70-PMW14B).

Although the Remedial Design (Geosyntec 2006b), proposes active remediation only within areas of TCE concentrations exceeding 250 µg/L, all multiple lines of evidence obtained during the performance monitoring are reviewed to assess additional treatment requirements. In review of the multiple lines of evidence, it appears that additional EVO injections in all biobarriers may be prudent to ensure that sufficient electron donor is present to continue degradation of the cis-DCE and VC that have been produced as a result of partial TCE dechlorination. In order of priority, the following biobarriers may be prioritized: SSB-1, SAB, and FSB-1. The rationale for the prioritization of these biobarriers is as follows:

- The SSB-1, where injections occurred between February and March 2009, is prioritized for EVO injections in the next year due to the time elapsed since injection, and also because SSB-1 is located at the most downgradient edge of the plume. In addition, TOC, VFA, and redox conditions suggest that EVO injections should be prioritized in the SSB-1.
- The SAB, the first biobarrier where injections occurred between November 2008 and January 2009, is prioritized for EVO injections in the next year as TCE concentrations were above 250 µg/L in MW-70-PMW02B (410 µg/L), and TOC and VFA concentrations show decreasing trends and are likely nearing depletion, as the initial injections occurred approximately 3.5 years ago.
- The FSB-1, where injections occurred between December 2009 and February 2010, is prioritized for EVO injections in the next year as the highest concentrations of TCE at IRP Site 70 in Fall 2011 was reported in MW-70-PMW06B at 3,900 µg/L, and TOC and VFAs show decreasing trends. It is crucial to ensure an adequate supply of donor is present in order to continue dechlorination of the TCE that is migrating into this Biobarrier.

It is anticipated that when additional electron donor is provided, Dhc and *vcr*A levels will increase in response to these injections.

Section3

CONCEPTUAL SITE MODEL UPDATE

The purpose of the CSM is to provide an analysis and visualization of both the subsurface hydrogeology and dissolved-phase TCE, cis-DCE, and VC plumes morphologies, which is achieved by using both two-dimensional (2-D) water level and plume contours and the three-dimensional (3-D) plume visualization. Over several CSM iterations, both the hydrogeology and the TCE contaminant spatial distribution have been improved and refined. This updated CSM provides a comprehensive understanding of the current conditions at Site 70 based on the Fall 2011 Performance monitoring program (Figures 3-1 through 3-13). Specific data include:

- Water level elevation data from Fall 2011 annual groundwater monitoring event;
- Groundwater sampling results from Fall 2010 and 2011. These data were input into Environmental Visualization Software (EVS) as a standalone data set to compare the current conditions to the baseline conditions prior to implementing the EISB system.
- In addition to TCE, the daughter products of reductive dechlorination were incorporated into the model. Specifically, cis-DCE, VC and ethene data sets were included as part of the 2011 3-D CSM visualization.

The CSM is described in the remainder of this section. The updated model is compared to the CSM that was developed using results of the baseline sampling that was performed before the EISB remedy was put in place. Changes that have occurred at the site are discussed.

3.1 LITHOLOGY

The lithology encountered during the drilling of Second Sand well MW-70-49 and reconstruction of First Sand Well RDO-04, supports the previous lithological characterizations. Hence, no new lithologic information was included in the 2011 performance monitoring sampling event. As such, the hydrogeology of IRP Site 70 in the CSM was based on the August 2008 revision of the CSM generated by EVS. A summary of the subsurface hydrogeology is outlined below using the six separate hydrostratigraphic units as model layers. The hydrostratigraphic zones are illustrated in cross-sections Figures 3-2 and 3-3 through the Source Area and through a longitudinal cross-section through the plume in Figures 3-8 through 3-11. The lithologic units are described below:

Upper Fines Unit (below the fill to approximately 60 ft bgs [-48 ft msl]). The Upper Fines Unit is comprised of the following five subunits.

- **Clay 1:** The unit consists of predominantly clayey soils from below the fill to a depth of approximately 20 ft bgs [-8 ft msl] (i.e., “surficial fines”);
- **Sand 1:** Starting approximately at a depth of 20 ft bgs [-8 ft msl], a predominantly fine-grained sand is intercepted that ranges in thickness from 2 to 17 ft thick (i.e., “20 ft sand”);
- **Clay 2:** Starting approximately at a depth of 30 to 38 ft bgs [-18 to -26 ft mal], a predominantly clayey unit is intercepted that ranges in thickness from approximately 3 to 10 ft thick (i.e., “30 ft fines”);

- **Sand 2:** Starting at a depth of 38 to 57 ft bgs [-26 to -45 ft msl], a fine- to medium-grained sand unit is intercepted that ranges in thickness from 13 to 20 ft thick (i.e., "40 ft sand"); and
- **Clay 3:** Starting at a depth of approximately 57 to 60 ft bgs [-45 to -48 ft msl], a silty clay to clay layer is intercepted that ranges in thickness from 2 to 3 ft thick (i.e., "60 ft clay").

- **First Sand Unit (approximately 60 to 105 ft bgs [-48 to -93 ft msl]).** The First Sand Unit consists of interbedded fine-grained and medium-grained sands and silty sands. A coarse sand/fine gravel layer was encountered in several borings between 80 and 95 ft bgs [-68 to -83 ft msl], and localized clays layers were noted between 80 to 90 ft bgs [-68 to -88 ft msl] in several SAB injection wells. The First Sand Unit varies in thickness from approximately 30 to 50 ft.
- **Shell Horizon Unit (approximately 105 to 135 ft bgs [-93 to -123 ft msl]).** The Shell Horizon Unit is consists a sequence of inter bedded clays, silts, sands, and gravels with laterally discontinuous interbeds of dense shells and shell fragments. In the source area, this unit is comprised of a sequence of interbedded clays, silts, sands, and gravels. The unit transitions to predominantly fine grained sand near RDO well RDO-6A/B between First and Second Streets in the dissolved-phase plume area. Within the CSM, the Shell Horizon has been subdivided into the Shell Horizon Clays (interbedded) and Shell Horizon Sand (fine-grained) to reflect differences in the hydrogeologic characteristics and potential plume migration behavior.
- **Second Sand Unit (approximately 135 to 170 ft bgs [-123 to -158 ft msl]).** Similar in character to the First Sand Unit, however, this lower unit appears to be slightly coarser in its upper section.
- **Deep Clay Unit (approximately 170 to 190 ft bgs).** The Deep Clay Unit consists of upper clay to silty clay horizon and an underlying clayey silt, silt, sandy silt, or sandy clay layer. The upper clay to silty clay horizon appears to be a continuous low-permeability unit that is encountered at depths ranging between 164 to 176 ft bgs. The upper clay to silty clay unit grades downward to clayey silt, silt, sandy silt, or sandy clay. This underlying layer is 3 to 20 ft thick, extending to depths of 175 to 188 ft bgs. Below the clayey silt, silt, sandy silt, or sandy clay layer is a silty sand and sand layer, up to 6 feet thick, which has been found to a depth of 191 ft bgs in extended removal site evaluation (ERSE) borings at NAVWPNSTA Seal Beach.
- **Deep Sand Unit (approximately 190 ft bgs and below).** The Deep Sand Units has fine-grained sands and silty sands and appears to be similar in character to the First and Second Sand Units. It should be noted that the Deep Sand Unit has been logged in only a few boreholes on NAVWPNSTA Seal Beach (BEI 2002).

3.2 CONTAMINANTS OF CONCERN IN GROUNDWATER

This section discusses the COCs in relation to the TCGs (Table 1-3) in each of the hydrostratigraphic zones based on the groundwater monitoring results during the 2011 sampling events (Tables 2-3 through 2-14; Figures 2-27 through 2-38). The most recent analytical results are compared to the 2008 baseline event to demonstrate the transformation of the dissolved plume since the EISB implementation. In addition, the overall projected 250 µg/L dissolved TCE plume is evaluated and compared to the extent of the cis-DCE and VC plumes to update the CSM with respect to the dissolved plume at IRP Site 70 during the Fall 2011 annual performance monitoring (Figures 2-40 and 2-41). Baseline groundwater monitoring plume maps are presented in Appendix H.

3.2.1 UPPER FINES/SOURCE AREA TREATMENT GROUNDWATER QUALITY

Groundwater samples were collected from 14 designated Upper Fines Unit during the Fall 2011 groundwater monitoring event (Figures 2-27 through 2-29). Nine Upper Fines SATG wells and five Upper Fines POC wells (MW-70-02, MW-70-03, MW-70-10, MW-70-17 and MW-70-22) were sampled during this event. The Upper Fines Unit wells are screened between 20 ft and 60 ft bgs. Analytical results for the groundwater samples collected from designated Upper Fines Unit wells are summarized in Tables 2-3 and 2-4.

Groundwater samples were collected from the Upper Fines Unit wells in Fall 2011 and analyzed for VOCs using United States Environmental Protection Agency (U.S. EPA) Method 8260B (Tables 2-3 and 2-4). The VOC results for the Upper Fines Unit wells were compared to the TCGs (Table 1-3). Additionally, non-COC VOCs were compared to U.S. EPA and Cal/EPA maximum contaminant levels (MCLs). The following trends are summarized for the VOCs in the Upper Fines Unit:

- Concentrations of TCE above the TCGs were reported in five out of 14 Upper Fines Unit wells in Fall 2011. The highest concentration of TCE (2,800 µg/L) was reported in MW-70-MNA01.
- Concentrations of cis-DCE above the TCGs were reported in six out of 14 Upper Fines Unit wells. The highest concentration of cis-DCE (1,500 µg/L) was reported in MW-70-27.
- Concentrations of trans-1,2-DCE above the TCGs were reported in four out of 14 Upper Fines Unit wells. The highest concentration of trans-1,2-DCE (56 µg/L) was reported in MW-70-MNA01.
- Concentrations of VC above the TCGs were reported in eight out of 14 Upper Fines Unit wells. The highest concentration of VC (2,200 µg/L) was reported in MW-70-PMW01B.
- Concentrations of 1,1-DCE, chloroform, and tetrachloroethylene (PCE) were not reported above the TCGs or laboratory detection limits in wells sampled in the Upper Fines Unit wells in Fall 2011.

The following non-COC VOCs were reported in at least one Upper Fines Unit well above laboratory detection limits or estimated values, flagged as "J" by the laboratory in Fall 2011: 1,1,1-trichloroethane, 1,1,2-trichloroethane, 1,1-dichloroethane, 1,2-dichloroethane, 1,2-dichloropropane, 2-butanone, 2, hexanone, acetone, benzene, carbon disulfide, chloroethane, dichlorodifluoromethane, Freon 113, methylene chloride, methyl tert-butyl ether (MTBE), and trichlorofluoromethane. Of these contaminants, concentrations of 1,2-dichloroethane in wells MW-70-MNA03 (8 µg/L) and MW-70-MNA04 (6 µg/L) were above the MCL of 5 µg/L. Concentrations of 1,2-dichloropropane in well MW-70-MNA03 (5.6 µg/L) was above the MCL of 5 µg/L.

MTBE was reported in POC well MW-70-02 at a concentration of 27 µg/L, which may be indicative of off-site petroleum contamination. MTBE was reported in 2009 and 2010 at MW-70-02 at concentrations of 2.4 and 2.8 µg/L, respectively. In review of the State Water Resources Control Board GeoTracker web site, there are three Leaking Underground Tank

(LUST) Cleanup Sites, one site of which the LUST cleanup status is still open, located directly upgradient and off-site of IRP Site 70 which may be potential sources of the MTBE (SWRCB, 2012).

3.2.2 FIRST SAND GROUNDWATER QUALITY

Groundwater samples were collected from 36 designated First Sand Unit during the Fall 2011 groundwater monitoring event (Figures 2-30 through 2-32). Seven First Sand Source Area Biobarrier, 16 First Sand Biobarrior-1, nine First Sand Biobarrior-2, and four First Sand POC wells (MW-70-11, MW-70-16, MW-70-35 and MW-70-POC01) were sampled during this event. The First Sand Unit wells are screened between 60 ft and 105 ft bgs. Analytical results for the groundwater samples collected from designated First Sand Unit wells are summarized in Tables 2-5 through 2-8.

Groundwater samples were collected from designated First Sand Unit wells in Fall 2011 and analyzed for VOCs, using U.S. EPA Method 8260B. The VOC results for the First Sand Unit wells were compared to the TCGs (Table 1-3). Additionally, non-COC VOCs were compared to U.S. EPA and Cal/EPA MCLs. The following trends are summarized for the VOCs in the First Sand Unit:

- Concentrations of TCE above the TCGs were reported in 11 out of 36 First Sand Unit wells in Fall 2011. The highest concentration of TCE (3,900 µg/L) was reported in MW-70-PMW06B.
- Concentrations of 1,1-DCE above the TCGs were reported in four out of 36 First Sand Unit wells in Fall 2011. The highest concentration of 1,1-DCE (11 µg/L) was reported in MW-70-PMW04A. Concentrations of cis-DCE above the TCGs were reported in 18 out of 36 First Sand Unit wells. The highest concentration of cis-DCE (1,800 µg/L) was reported in MW-70-PMW06A.
- Concentrations of trans-1,2-DCE above the TCGs were reported in five out of 35 First Sand Unit wells. The highest concentration of trans-1,2-DCE (50 µg/L) was reported in MW-70-PMW06B.
- Concentrations of VC above the TCGs were reported in 19 out of 36 Upper Fines Unit wells. The highest concentration of VC (850 µg/L) was reported in MW-70-38.
- PCE and chloroform were not reported above the TCGs or laboratory detection limits in groundwater samples collected from the First Sand Unit in Fall 2011. Additionally, no COCs, above the TCGs were reported in the First Sand POC wells (Table 2-8).

The following non-COC VOCs were reported in at least one First Sand Unit wells above detection limits or estimated values, flagged as “J” by the laboratory in Fall 2011: 1,1-dichloroethane, 4-methyl-2-pentanone, acetone, carbon disulfide, chloroethane, dichlorodifluoromethane, ethylbenzene, o-xylene, and toluene. No non-COC VOC concentrations were reported above the MCLs in the First Sand Unit.

3.2.3 SHELL HORIZON GROUNDWATER QUALITY

Groundwater samples were collected from 13 designated Shell Horizon Unit wells during the Fall 2011 groundwater monitoring event (Figures 2-33 through 2-35). Five Shell Horizon Biobarrier-1, seven Shell Horizon Biobarrier-2, and one Shell Horizon POC (MW-70-23) wells were sampled during this event. The Shell Horizon Unit wells are screened between 105 ft and 135 ft bgs. Analytical results for the groundwater samples collected from the Shell Horizon Unit wells are summarized in Tables 2-9 through 2-11.

Groundwater samples were collected from the Shell Horizon Unit wells in Fall 2011 and analyzed for VOCs using U.S. EPA Method 8260B. The VOC results for the Shell Horizon Unit wells were compared to the TCGs (Table 1-3). Additionally, non-COC VOCs were compared to U.S. EPA and Cal/EPA MCLs. The following trends are summarized for the VOCs in the Shell Horizon Unit:

- VOCs above the TCGs or laboratory detection limits were not reported in the designated Shell Horizon POC wells in Fall 2011(Table 2-11).
- Concentrations of TCE above the TCGs were reported in 7 out of 13 Shell Horizon Unit wells in Fall 2011. The highest concentration of TCE (45 µg/L) was reported in MW-70-PMW10.
- Concentrations of 1,1-DCE above the TCGs were reported in one out of 13 Shell Horizon Unit wells in Fall 2011. 1,1-DCE at concentration of 11 µg/L was reported in MW-70-PMW10. Concentrations of cis-DCE above the TCGs were reported in 9 out of 13 Shell Horizon Unit wells. The highest concentration of cis-DCE (2,900 µg/L) was reported in MW-70-PMW10.
- Concentrations of trans-1,2-DCE above the TCGs were reported in six out of 13 Shell Horizon Unit wells. The highest concentration of trans-1,2-DCE (48 µg/L) was reported in MW-70-PMW10.
- Concentrations of VC above the TCGs were reported in 11 out of 13 Shell Horizon Unit wells. The highest concentration of VC (330 µg/L) was reported in MW-70-PMW11B.
- PCE and chloroform were not reported above the TCGs or laboratory detection limits were reported in groundwater samples collected from the Shell Horizon Unit in Fall 2011.

The following non-COC VOCs were reported in at least one Shell Horizon Unit wells above detection limits or estimated value, flagged as "J" by the laboratory in Fall 2011: 1,1-dichloroethane, 2-butanone, 2-hexanone, 4-methyl-2-pentanone, acetone, carbon sulfide, dichlorodifluoromethane, and toluene. No non-COC VOC concentrations above the MCLs were reported in the Shell horizon Unit.

3.2.4 SECOND SAND GROUNDWATER QUALITY

Groundwater samples were collected from 13 Second Sand Unit during the Fall 2011 groundwater monitoring event (Figures 2-36 through 2-38). Nine Second Sand Biobarrier and three Second Sand POC wells (MW-70-21, MW-70-23 and MW-70-36) were sampled during

this event. Analytical results for the groundwater samples collected from the Second Sand Unit wells are summarized in Tables 2-12 and 2-13.

Groundwater samples were collected from the Second Sand Unit wells in Fall 2011 and analyzed for VOCs using U.S. EPA Method 8260B. The VOC results for the Second Sand Unit wells were compared to the TCGs (Table 1-3). Additionally, non-COC VOCs were compared to U.S. EPA and Cal/EPA MCLs. The following trends are summarized for the VOCs in the Second Sand Unit:

- Concentrations of TCE above the TCGs were reported in six out of 13 Second Sand Unit wells in Fall 2011. The highest concentration of TCE (300 µg/L) was reported in MW-70-PMW13A.
- Concentrations of cis-DCE above the TCGs were reported in six out of 13 Second Sand Unit wells. The highest concentration of cis-DCE (1,100 µg/L) was reported in MW-70-PMW13B.
- Concentrations of trans-1,2-DCE above the TCGs were reported in three out of 13 Second Sand Unit wells. The highest concentration of trans-1,2-DCE (99 µg/L) was reported in MW-70-PMW13A.
- Concentrations of PCE above the TCGs were reported in one out of 13 Second Sand Unit wells. The highest concentration of PCE (8 µg/L) was reported in MW-70-36.
- Concentrations of VC above the TCGs were reported in six out of 13 Second Sand Unit wells. The highest concentration of VC (300 µg/L) was reported in MW-70-PMW13A. Additionally, VC concentration of 300 was reported in MW-70-PMW14B.
- Chloroform and 1,1-DCE were not reported above the TCGs in any Second Sand Unit wells.

The following non-COC VOCs were reported in at least one Second Sand Unit wells above detection limits or estimated value, flagged as "J" by the laboratory in Fall 2011: 1,1-dichloroethane, 4-methyl-2-pentanone, acetone, carbon sulfide, chloroethane, methylene chloride, and toluene.

No non-COC VOC concentrations above the MCLs were reported in the Second Sand Unit.

3.2.5 DEEP SAND GROUNDWATER QUALITY

Groundwater samples were collected from three Deep Clay Unit wells during the Fall 2011 groundwater monitoring event. All three Deep Sand POC wells (MW-70-POC02, MW-70-POC03 and MW-70-POC04) were sampled during this event (see Figure 2-10 for well locations). The Deep Sand wells are screened between 190 ft and 205 ft bgs. Analytical results for the groundwater samples collected from the Deep Sand wells are summarized in Table 2-14.

Groundwater samples were collected from the Deep Clay Unit/Deep Sand POC, collectively Deep Sand wells in Fall 2011 and analyzed for VOCs using U.S. EPA Method 8260B (Table 2-14). The VOC results for the Deep Sand wells were compared to the TCGs (Table 1-3). Additionally, non-COC VOCs were compared to U.S. EPA and Cal/EPA MCLs. The following trends are summarized for the VOCs in the Deep Sand Unit:

- VOCs above the TCGs or laboratory detection limits were not reported in any of the Deep Sand POC wells.

With the exception of toluene in MW-70-POC04 at concentrations of 2 µg/L, no non-COC VOCs were reported in the Deep Sand Unit wells in Fall 2011. Toluene was reported at a concentration of 2.0 µg/L in MW-70-POC04.

3.3 VISUALIZATION AND SUMMARY OF DISSOLVED PLUME EXTENT

The groundwater data from the Fall 2011 Performance monitoring event were imported into an updated post-EISB 3-D visualization software (EVS) as a separate, standalone data set. By having the 2008 and 2010 data sets generate separate models, the extent of the current TCE plume to the baseline plume is compared to provide a better understanding of progress achieved at IRP Site 70 to date. A discussion on the spatial extent of the chlorinated ethenes is provided in the subsequent subsection based on the following EVS visualization figures 3-1 through 3-13 and 2-D plume contours (Figures 2-27 through 2-38):

- **2-D CONTOURS OF TCE -** The plume extent for TCE greater than 1000 µg/L in the Source Area is depicted in Figure 3-1. Two cross-sectional views of TCE concentrations greater than 250 µg/L in the source area are shown in Figures 3-2 and 3-3. In addition, the 2008 and 2011 2-D TCE plume extent is projected to the surface to show the change in TCE plume morphology through the units in Figures 2-40 and 2-41, respectively.
- **3-D PLUME MORPHOLOGY** – As part of the visualization of the dissolved plume morphology, 3-D figures were generated using EVS for TCE, cis-DCE, VC, and Ethene (Figures 3-4 through 3-7). The 3-D plume figures are shown at TCE concentrations greater than 250 µg/L (Figure 4-25), the design basis concentration for which the active bioremediation was designed (Geosyntec 2006b). The reductive dechlorination daughter products, cis-DCE, VC, and Ethene are depicted at 60 µg/L for cis--DCE (Figure 3-5), 20 µg/L for VC (Figure 3-6), and 10 µg/L for ethene. These figures present the chlorinated ethene (i.e., TCE, cis-DCE, VC, and ethene) plume morphologies in three view points: plan, oblique, and profile . In addition, 3D plume maps through time are presented in Figures 3-12 and 3-13.
- **SELECTED CROSS-SECTIONS -** To provide an understanding through the center line of the plume, longitudinal cross-section (J-J') figures were generated for TCE, cis-DCE and VC (Figures 3-8 through 3-11 respectively).

3.3.1 TRICHLOROETHENE

Overall changes noted during the post-EISB performance monitoring, include a reduction in the number of wells where concentrations of TCE greater than 250 µg/L were observed. In 2011, a total of 5 out of 80 wells reported TCE concentrations greater than 250 µg/L compared to 11 out of 86 wells during the baseline in Fall 2010. In comparison to the baseline CSM, the updated greater than 250 µg/L 2011 TCE plume distribution shows substantial decreases in width (orthogonal to the plume axis [cross-section line J-J'] in plain view), length (parallel to the plume axis [J-J'] in plain view) and depth (vertical distribution along J-J') (Figure 3-8). These comparisons are based on the numerical model calculated using the 2011 monitoring results.

The projected TCE extent comparison between 2008 and 2011 is shown in Figures 2-40 and 2-41. The highest TCE concentration of 3,900 µg/L was reported in First Sand well MW-70-PMW06B (Figure 2-30).

The extent of the 250 µg/L TCE plume has been reduced significantly between 2010 and 2011 as observed in 2D Figures 2-27, 2-30, 2-33, and 2-36 in the Upper Fines, First Sand, Shell Horizon, and Second Sand Units, respectively. The TCE 3D Plume morphology changes between 2010 and 2011 are shown in Figures 3-4 and 3-12.

The extent of the 5 µg/L (MCL) TCE plume has also been reduced upgradient of SSB-1. Downgradient of SSB-1, the extent of the 5 µg/L (MCL) TCE plume appears stable, with the toe of the plume remaining relatively in the same location relative to furthest downgradient well MW-70-15. In this area, TCE concentrations in MW-70-15 were 16, and 14 µg/L in 2010 and 2011, respectively. TCE concentration reported in the newly constructed Second Sand well, MW-70-49, was 17 µg/L in Fall 2011, defining the northeast width of the plume.

TCE was reported at an estimated concentration of 0.33 µg/L in First Sand POC well MW-70-35 in Fall 2011. TCE was reported in MW-70-35 during the Baseline 2008 sampling at a concentration of 0.45 µg/L. TCE was not reported in any other compliance wells during the recent performance monitoring event, suggesting that the plume remains contained within the point of compliance well boundary.

3.3.2 CIS-1,2-DICHLOROETHENE

The greater than 60 µg/L cis-DCE plume of the 2011 updated post-EISB CSM, as shown in Figures 3-5 and 3-13, is distributed across the site and generally mimics the distribution of the greater than 60 µg/L cis-DCE plume represented in the 2010 CSM. The highest concentration of cis-DCE has been reported in MW-70-PMW10 at 2,900 µg/L in the Shell Horizon. The cis-DCE 3D plume morphology is presented in Figures 3-5 and 3-13.

During the Fall 2011 post-EISB performance monitoring a total of 52 out of 80 wells reported cis-DCE concentrations greater than 60 µg/L, compared to 29 out of 86 wells sampled in Fall 2010. Of the compliance wells sampled in Fall 2011, cis-DCE was reported in First Sand POC wells MW-70-11 and MW-70-35 at concentrations of 1.1 and 1.4 µg/L, respectively, which are below the MCL of 6 µg/L, consistent with 2010 performance monitoring results. Cis-DCE was not reported in any of the compliance wells, suggesting that the cis-DCE plume is completely contained within the point of compliance well boundary.

3.3.3 VINYL CHLORIDE

The greater than 20 µg/L VC plume of the 2011 updated post-EISB CSM, is shown in Figures 3-6 and 3-13. The highest concentration of VC in Fall 2011 was 2,200 µg/L reported in MW-70-PMW01B in the Source Area. The 3D plume morphology for 2011 is shown on Figures 3-6 and 3-13.

During the 2011 post-EISB performance monitoring, a total of 22 out of 80 wells reported VC concentrations greater than 20 µg/L, compared to 24 out of 86 wells sampled in Fall 2010. VC was reported in the Deep Sand POC MW-70-POC02 at an estimated concentration of 0.24 µg/L, which is similar to the estimated 0.20 µg/L reported VC concentration reported in 2010 in the same POC well. VC was not reported in any of the other compliance wells during the 2011 performance monitoring event, suggesting that the plume is completely contained within the point of compliance well boundary.

3.3.4 ETHENE

The greater than 10 µg/L ethene plume of the 2011 updated post-EISB CSM is shown in Figures 3-7 and 3-11. The highest concentration of ethene in Fall 2011 was 540 µg/L reported in MW-70-PMW01B in the Source Area. The 3D plume morphology for 2011 is shown on Figures 3-7 and 3-11. Ethene was not reported in any of the point of compliance wells. The high VC and ethene concentrations in the Source Area support the evidence of successful dechlorination occurring in the Source Area and throughout the biobarriers.

3.4 CONCLUSIONS

Based on the above discussion, the following conclusions can be drawn from the 2011 updated CSM.

- **Groundwater Level:** Water level elevations have increased approximately 2-12 feet in all hydrostratigraphic zones since 2010, which may be attributable to an increase in rainfall in WY2011. However, hydraulic gradients and direction of groundwater flow remain consistent compared to previous years (see Section 2).
- **TCE:** The greater than 250 µg/L TCE plume from the 2011 updated post-EISB CSM shows marked decreased in the width, length and vertical distribution of TCE compared to 2010. The extent of the 5 µg/L (MCL) TCE plume has also been reduced and appears stable in the downgradient area of the Second Sand at MW-70-15. The updated CSM indicates that the plume is completely contained within the point of compliance well boundary.
- **Cis-DCE:** The greater than 60 µg/L cis-DCE plume from the 2011 updated post-EISB CSM, mimics the morphology of the greater than 60 µg/L cis-DCE plume in 2010. The updated CSM indicates that the plume is completely contained within the point of compliance well boundary.
- **VC:** The greater than 20 µg/L VC plume from the 2011 updated post-EISB CSM has a similar distribution to that of the VC plume in 2010. The updated CSM indicates that the plume is completely contained within the point of compliance well boundary.
- **Ethene:** The greater than 10 µg/L ethene plume of the 2011 updated post-EISB CSM is shown in Figures 3-7 and 3-11. The highest concentration of ethene in Fall 2011 was 540 µg/L reported in MW-70-PMW01B in the Source Area. Ethene was not reported in any of the point of compliance wells.
- **Soil Vapor:** Soil vapor monitoring indicates methanogenesis is occurring in the SATG and SAB areas and requires continued monitoring (see Section 2).

EISB is successfully working to reduce the TCE concentrations through dechlorination as shown by the resultant decrease in the TCE plume morphology.

Section 4

VARIANCES TO THE WORK PLAN AND THE DATA QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

This section summarizes the variances to the RAWP and the Data Quality Assurance/Quality Control results for the period between January 2011 and December 2011.

4.1 VARIANCES TO THE WORK PLAN

The primary variance to the RAWP during this period is changes to the performance monitoring schedule. The RAWP tentative sampling schedule (Table 6.2 of RAWP, ECC/Geosyntec 2008a; AIS/TN&A 2011) indicates quarterly sampling for year one, followed by semi-annual and annual sampling. Per the monitoring schedule presented in the RAWP, quarterly sampling consisted of monitoring 11 wells (4 SATG wells, 1 SAB well, 2 FSB-1 wells, 1 FSB-2 well, 1 SHB-1 well, 1 SHB-3 well, and 1 SSB-1 well). The 2011 performance monitoring schedule is presented in Table 1-1 and consisted of the following frequency of wells:

1. Semi-Annual Monitoring Event (July/August 2011) - Field parameters were measured in 47 wells, and off-site laboratory analytical sampling was conducted in 35 wells: SATG (4 wells), SAB-1 (3 wells); FSB-1 (9 wells); FSB-2 (5 wells); SHB-1 (3 wells); SHB-3 (4 wells); and SSB-1 (7 wells, including newly installed monitoring well MW-70-49). Field monitoring consisted of: depth to water measurements (in 74 wells), pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, and turbidity. Off-site laboratory analyses consisted of: VOCs, DHGs, anions, VFAs, TDS, alkalinity, and TOC (Tables 2-3 through 2-15).
2. Annual Monitoring Event (October/November 2011) - Field parameters and off-site laboratory analytical sampling was conducted in 74 monitoring wells and 14 POC wells: SATG (16 wells); SAB (8 wells); FSB-1 (16 wells); FSB-2 (9 wells); SHB-1 (5 wells); SHB-3 (8 wells); SSB-1 (12 wells); POC wells (14 wells). Field parameters consisted of: depth to water measurements (in 75 wells), pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, and turbidity. Off-site laboratory analyses consisted of: VOCs, DHGs, anions, VFAs, TDS, alkalinity, TOC and Dehalococcoides with the vinyl chloride reductase A gene (Dhc/vcrA) (Tables 2-3 through 2-15).

The frequency and sampling of the wells was determined to adequately address the RA objectives at IRP Site 70.

4.2 QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

This section summarizes quality assurance and quality control findings of the analytical results sampled during this performance period. Groundwater from 88 monitoring wells (75 monitoring wells and 13 injections wells), selected for semi-annual and annual groundwater monitoring were sampled and analyzed in accordance with the Final SAP and SAP Addendum (ECC/Geosyntec 2008a; Insight 2009b). All groundwater samples were analyzed by EMAX Laboratories located in Torrance, California, except for deoxyribonucleic acid (DNA) assay

analysis which was analyzed by SiREM located in Ontario, Canada. Appendix C summarizes laboratory analyses performed on groundwater samples collected from each well at IRP Site 70 in Summer 2011 and Fall 2011, and Tables 2-3 through 2-15 present all groundwater results. The results of the groundwater 2011 performance monitoring are summarized in Section 2. Appendix D details data usability assessment and data validation reports. Table 4-1 summarizes the results of the assessment for the data quality indicators of accuracy, precision, completeness, comparability and representativeness.

Procedures from the following methods were used to analyze groundwater and field quality control samples:

- VOCs were analyzed using U.S. EPA Method 8260B With the exception of IW-70-SHB113 in 2008 (Table 3-8) and IW-70-SHB310 in 2009 (Table 3-9), no other reporting limits for VOCs where changed;
- DHGs consist of ethane, ethene, and methane and were analyzed using RSK 175;
- Anions (bromide, chloride, sulfate, nitrate, nitrite) were analyzed using U.S. EPA Method 300.0;
- VFAs (acetate, butyrate, lactate, propionate) were analyzed using U.S. EPA Method 300.0M;
- TOC was analyzed using Standard Method 5310B;
- Dissolved Hydrogen Sulfide was analyzed using Standard Method 4500F;
- TDS was analyzed using Standard Method 2540C;
- Dissolved Metals (arsenic, iron, manganese) were analyzed using U.S. EPA Method 6010B; and
- DNA assay analysis was analyzed using SiREM developed Quantitative Gene-Trac Test.

Soil gas vapor samples were collected for analysis of methane and hydrogen sulfide at 12 locations presented in Figure 1-3 using U.S. EPA Methods 25C and 16, respectively. Methane vapor samples were analyzed by Calscience Environmental located in Garden Grove, California. If methane was not detected using Method 25C, then the sample was reanalyzed using Method 3C. The purpose of the soil vapor probes and sampling was to monitor migration of methane and hydrogen sulfide in the vadose zone in the source area and downgradient of the source area.

The laboratory's quality assurance oversight involved the performance of a first-level screening of the data and an indication of any deviations from their precision, accuracy, detection limit, or laboratory QA/QC criteria. A copy of the laboratory QA/QC analytical results can be found in Appendix C. A representative from the laboratory signed the data sheets, ensuring that the screening described above had been completed. Subsequently, Insight completed data review by comparing chain-of-custody forms, sample receipts, sample log-ins, and laboratory data packages. Review of these summaries confirmed that data quality objectives were met.

Additionally, the analytical data, along with the associated laboratory quality control information, were forwarded to Laboratory Data Consultants, Inc., an independent data validation service, for data validation. A U.S. EPA Level III data validation was performed on 90 percent of the groundwater samples; the remaining 10 percent of the samples underwent a Level IV data validation. Copies of the chain-of-custody documentation are included in Appendix B.

Data validation includes evaluation of holding times, sample preservation, cooler temperatures, calibrations, blanks, laboratory quality control samples, and field quality control samples. Generally, the results were within analytical criteria with a few minor exceptions, such as calibration outliers of some VOCs, detection of carbon disulfide in the laboratory method blank, and low spike recovery during alkalinity testing. For the most part calibration outliers affected VOCs that are not constituents of concern of Site 70. All affected compounds were qualified "J" or "UJ".

QA/QC measurements were taken in the field to ensure that meaningful and representative data sets were generated. Field duplicate samples were collected at a rate of 10 percent of the total number of groundwater monitoring wells sampled and one trip blank sample was included in each cooler that contained volatile organic analysis vials. These samples were collected to ensure the consistency and integrity of sample collection methods. Field duplicate samples were collected for wells MW-70-27, MW-70-PMW03B, MW-70-PMW04A, MW-70-PMW06B, MW-70-MNA12, IW-70-SHB217, MW-70-PMW12A, and MW-70-MNA16. Field duplicate results are generally similar to the original results and no significant problems were noted. Twenty-five trip blank samples were shipped. No VOC contaminant was reported in the trip blanks with the exception of methylene chloride (0.67 J µg/L). Five equipment rinse samples were collected. No contaminants of concern were reported with the following exceptions:

Client Sample ID	Sample Date	Analyte Name	Result	Qualifiers	Result Units
IR-70-GW-EB-055	07/27/2011	Methane	1.9	J	µg/L
IR-70-GW-EB-062	08/05/2011	Chlorobenzene	0.34	J	µg/L
IR-70-GW-EB-062	08/05/2011	Methane	0.36	J	µg/L
IR-70-GW-SB-054	07/27/2011	Methane	3.6		µg/L
IR-70-EB-166	11/22/2011	Chlorobenzene	0.28	J	µg/L
IR-70-EB-166	11/22/2011	Chloroform	0.34	J	µg/L
IR-70-EB-166	11/22/2011	Bromodichloromethane	0.25	J	µg/L
IR-70-EB-171	11/23/2011	Chlorobenzene	0.25	J	µg/L
IR-70-EB-171	11/23/2011	Chloroform	0.30	J	µg/L
IR-70-EB-171	11/23/2011	Bromodichloromethane	0.24	J	µg/L
IR-70-EB-177	11/28/2011	Chlorobenzene	0.38	J	µg/L

Two Source blanks were collected. No contaminants of concern were reported with the following exceptions:

Client Sample ID	Sample Date	Analyte Name	Result	Qualifiers	Result Units
IR-70-SB-165	11/22/2011	Chlorobenzene	0.29	J	µg/L
IR-70-SB-165	11/22/2011	Chloroform	0.35	J	µg/L
IR-70-SB-165	11/22/2011	Carbon disulfide	0.26	J	µg/L
IR-70-SB-165	11/22/2011	Bromodichloromethane	0.28	J	µg/L

Data were generally found to be acceptable with respect to accuracy, precision, completeness, and comparability criteria (Table 4-1). All analytical data presented in Tables 2-3 through 2-15 are valid and usable. Validation findings were advisory and findings are detailed in Appendix D.

Section 5
LAND USE CONTROL DOCUMENTATION

This section documents the Land Use Controls (LUCs) implemented at IRP Site 70, per the Record of Decision and RAWP (Geosyntec 2006a; ECC/Geosyntec 2008a). LUC objectives are achieved through the land-use restrictions and include:

- Preventing the use of VOC-contaminated groundwater until cleanup objectives have been achieved,
- Protecting the groundwater monitoring and extraction wells and associated piping and equipment
- Managing intrusive activities to minimize potential human exposure to contaminated groundwater, and
- Managing groundwater injection and extraction activities to assure that hydraulic control of the contaminant plume is not unacceptably compromised

The LUCs are applied to approximately 50 acres overlying the existing areas of contamination but extend to a half-mile radius buffer zone established for groundwater from the surface to a depth of 495 feet bgs. The institutional controls (ICs) addressing the on-station portion of the groundwater plume are implemented through the Station Project Review Process. Although off-base migration is unlikely, the United States Department of the Navy, Orange County Health Care Agency, OCWD, and city of Seal Beach determine ICs addressing the off-station portion of the groundwater plume to assure that any conditions necessary for adequate protection of public health. ICs are implemented to prevent use of or exposure to contaminated groundwater; protect the integrity of the RA; and allow access for sampling, installing, operating, and maintaining monitoring wells or remediation equipment, and implementing remedial measures needed in the future.

The following activities were managed as part of the on-station ICs since the remedy was implemented at IRP Site 70 since 2008:

1. Twenty-three SATG injection wells were constructed in May 2010 as part of implementation of the RA activities in the SATG
2. Second Sand Monitoring Well MW-70-49 was constructed in September 2011, northeast of the SSB-1, as documented in this PMR
3. Well RDO-04 was re-drilled and constructed in September 2011, as documented in this PMR
4. Two nested wells were constructed by OCWD and designated as OCWD-BS10 and OCWD-BS11 with coordination with NAVWPNSTA, south of IRP Site 70 (Appendix I). Each well was constructed with six nested wells, 2-inch polyvinyl chloride casing, with 10-20-foot screen intervals installed between 95 to 605 feet bgs. Well OCWD-BS11 is within the half-mile buffer zone established for groundwater. The purpose of these wells

was to provide additional water level and water quality data and permanent monitoring points for the Sunset Gap area in west Orange County. Water levels and Quality sampling were conducted in March and April 2012. Water samples were collected from each monitoring well and submitted to laboratories for the analyses of general mineral, VOC, perchlorate, and 1,4-dioxane. In review of the VOC and 1,4-dioxane results, all values were non-detect except for one sample collected in the upper most zone of OCWD-BS11, closest and downgradient of IRP Site 70, screened between 95-115 feet bgs. In this sample, cis-DCE and TCE were reported at 0.6 and 8.4 µg/L, respectively.

No activities have been found to violate the LUC objectives for IRP Site 70 as outlined in the Record of Decision and RAWP.

Section 6

SUMMARY AND RECOMMENDATIONS

The EISB remediation activities at IRP Site 70 are being conducted in accordance with the technical and functional requirements specified in the RAWP (ECC/Geosyntec 2008a). Field activities are being performed as established in the SOPs contained in Attachment B-2 of the SAP (AIS-TN&A 2011).

The 2011 Performance monitoring event documents the following field activities (Table 1-1, Figure 1-2):

- Groundwater-level elevations were measured during two events: July (74 wells) and October 2011 (76 wells).
- Groundwater samples were collected during two events in Summer 2011 and Fall 2011. The Summer 2011 groundwater sampling event consisted of collection of groundwater samples from 48 monitoring wells. The Fall 2011 groundwater sampling event consisted of collection of groundwater samples from 80 groundwater monitoring wells and analyzed for VOCs, DHGs, VFAs, anions, TDS, alkalinity, TOC, dissolved hydrogen sulfide, dissolved metals, and Dhc with *vcr*A (Table 1-1).
- Field parameters (groundwater temperature, pH, DO, ORP, specific conductance, and turbidity) and depth to water, were measured as part of the performance monitoring for the EISB activities, per the schedule outlined in Table 1-1.
- One new Second Sand Monitoring Well, designated as MW-70-49, was constructed in September 2011. The purpose of the Second Sand well at this location was to determine the downgradient concentration of VOCs in the Second Sand with respect to MW-70-14 and to better define the northeast lateral extent of the dissolved plume with respect to the SSB-1. In addition, RDO-4 was re-drilled and constructed since the casing had been found to be compromised prior to FSB-1 injection activities in December 2009. Well construction details are documented in Table 1-2 and Appendix F.
- Twelve soil vapor probes were sampled for methane and hydrogen sulfide.

6.1 SUMMARY OF REMEDY PERFORMANCE

Multiple lines of evidence were evaluated and support that EISB is working effectively at the biobarrier areas at IRP Site 70. The different geochemical parameters that were monitored are summarized as follows:

1. The presence of TCE in the Source Area at 2,900 µg/L and a maximum site-wide TCE concentration of 3,900 µg/L in MW-70-PMW06B, upgradient of FSB-1, indicates that an ongoing source of TCE is present.
2. A significant reduction of total moles of all COCs is observed in all hydrogeologic zones since active remediation began. The 2011 performance monitoring data suggest

that degradation rates have slowed in all biobarriers. The primary transformation product is cis-DCE.

3. Electron donor concentrations were measured as TOC and VFA's in select wells. TOC concentrations decreased in the SAB, FSB-2, SHB-1, and SSB-1. In 2011, groundwater VFA results for the injection wells were non-detect for almost all injection wells except for IW-70-SAT35 (SATG). In general, the concentration of VFAs in the PMWs remained below or at detection limits with one exception. These data indicate that EVO is being consumed by the fermenting population and utilized by anaerobic populations such as methanogens and dechlorinators.
4. In biobarriers SATG, SAB, FSB-1, SHB-3, and SSB-1, sulfate has been increasing and methane concentrations have generally been decreasing, indicating a reduction in methanogenesis in these biobarriers. A review of the performance monitoring wells in biobarriers FSB-2 and SHB-1 shows somewhat more variability.
5. Within all of the biobarriers, the DO concentrations were below 1 mg/L during the 2011 performance monitoring event, except for IW-70-SHB310 in the SHB-3 biobarrier. ORP readings collected during the 2011 monitoring events indicated that all of the upgradient and downgradient PMWs and biobarrier wells were within the range of -100 and -300 mV. There is a slight increasing trend of ORP reported in performance monitoring wells in biobarriers SATG, SAB, and FSB-1.
6. In the SATG, SAB, FSB-1 and FSB-2 biobarriers, in general, Dhc and *vcr*A concentrations were within or sometimes above the moderate range (10^4 to 10^7 cells/L) of concentrations. However, *vcr*A and Dhc concentrations were more variable and primarily below the lower limit of the moderate concentration range (10^4 to 10^7 cells/L) in some of the downgradient performance monitoring wells in SHB-1 (MW-70-PMW10), SHB-3 (PMW-12A) and SSB-1 (MW-70-PMW14B).

6.2 CONCEPTUAL SITE MODEL UPDATE

The CSM was updated to provide an analysis and visualization of both the subsurface hydrogeology and dissolved phase plume morphologies. The highlights of the CSM update for the 2011 PMR are summarized as follows:

- Groundwater elevations have increased approximately 2-12 feet in all hydrostratigraphic zones since 2010, which may be attributable to an increase in rainfall in Water Year 2011. Hydraulic gradients and directions remain similar to 2010. Groundwater monitoring data does not indicate that the injection of the biobarriers has impacted groundwater flow.
- The updated extent of the 250 µg/L plume for TCE was simulated using EVS in two- and three-dimensions and demonstrates that the post-EISB TCE dissolved plume has decreased in width, length and vertical distribution compared to the baseline CSM. The extent of cis-DCE and VC plume morphology in 2011 remains similar to 2010.
- The dissolved phase plume remains within the point of compliance boundary.

- Soil vapor monitoring at soil vapor wells, constructed at 6 feet bgs, indicates that methanogenesis is occurring in the SATG and SAB areas. However, the methane monitoring plan indicates no harmful vapors in the breathing zones monitored adjacent to utility corridors that may provide a potential pathway to the surface.

6.3 RECOMMENDATIONS

The data presented in the 2011 PMR support the RA goals for IRP Site 70 (Geosyntec 2006a) and demonstrate the RA is reducing the contaminant concentrations at IRP Site 70.

Based on the results of the 2011 PMR at IRP Site 70, the following recommendations are made:

1. In review of all the multiple lines of evidence, it appears that additional EVO injections in all biobarriers may be prudent to ensure that electron donor are present and that the *vcr*A population thrives. In order of priority, the following biobarriers may be prioritized: SSB-1, SAB, and FSB-1 based on the rate of consumption of EVO and the current VOC concentrations.
2. Based on the results of the 2011 PMR, semi-annual groundwater monitoring is recommended for the next performance monitoring year per Table 6-1. Optimization strategies may be further evaluated after each event and incorporated as needed to enhance performance monitoring results.
3. Since methane can accumulate in the subsurface and migrate to the surface, continued monitoring of methane in the vapor probes and monitoring at the surface is recommended. Special care (venting, use of explosion-proof meters, etc.) must be taken prior to any sampling or intrusive activities in this area to minimize the risk of fire or explosion. A methane monitoring plan has been put in place to ensure that onsite workers are protected. In addition, air monitoring for VOCs in these areas will be implemented as part of the monitoring plan.

Notes:

— - not analyzed

Anions/TDS/Alkalinity - Anions (EPA Method 300.0)/TDS (EPA Method 2540C)/Alkalinity (EPA Method 2320B)
Dhc/vcrA - Polymerase Chain Reaction Assay (Dehalococcoides/vinyl chloride reductase A gene)
DHGs - dissolved hydrogen gases (RSK 175)
dissolved metals - iron, manganese, and arsenic (EPA Method 6010B)
field parameter (pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, and turbidity)
sulfide - total dissolved hydrogen sulfide (EPA Method 4500F)
Soil Vapor samples analyzed for hydrogen sulfide (ASTM D5504) and methane(25C)
TOC - total organic carbon (EPA Method 5310B)
VFAs - volatile fatty acids (300.0M)
VOCs - volatile organic compounds (EPA Method 8260B)

Table 1-2

Acronyms/Abbreviations:
bgs - below ground surface
MSL - mean sea level
NM - not measured
NAD83 - North American Datum of 1983
NGVD29 - National Geodetic Vertical Datum of 1929
TOC - top of casing

Table 1-3
Contaminants of Concern and Target Cleanup Goals

Contaminant of Concern	Exposure Rate	Receptor(s)	Target Cleanup Goal (µg/L)
Chloroform	Ingestion	Future residential groundwater users	100
1,1-Dichloroethene	Ingestion	Future residential groundwater users	6
cis-1,2-Dichloroethene	Ingestion	Future residential groundwater users	6
trans-1,2-Dichloroethene	Ingestion	Future residential groundwater users	10
Tetrachloroethene	Ingestion	Future residential groundwater users	5
Trichloroethene	Ingestion	Future residential groundwater users	5
Vinyl Chloride	Ingestion	Future residential groundwater users	0.5

Source: ECC/Geosyntec (2008a) – Remedial Action Work Plan. Target Cleanup Goals are based on Applicable or Relevant and Appropriate Requirements. Reevaluation of the Target Cleanup Goals may be required at a future date, per trends in remedial performance.

Note:
µg/L – micrograms per liter

Table 1-4
Summary of Performance Monitoring Rationale

Measurement	Primary Purpose
Groundwater elevations	Ensure barriers are not impacting groundwater flow direction
VOCs	Monitor changes in plume size/location
VOCs and Dhcs	Evaluate remedial performance
Geochemistry (DO, ORP, pH, nitrate, sulfate, ferrous iron)	Determine conditions are present for Dhc survival and proliferation
TOC and VFAs	Determine distribution of EVO
qPCR (Dhc and *vcr*A)	Track growth and distribution of Dhc in groundwater
Dissolved metals	Evaluate impacts to groundwater quality

Acronyms/Abbreviations:

Dhc – *Dehalococcoides*
DO – dissolved oxygen
EVO – emulsified vegetable oil
ORP – oxidation-reduced potential
pH – potential of hydrogen
qPCR – quantitation polymerase chain reaction
TOC – total organic carbon
VFA – volatile fatty acid
*vcr*A – vinyl chloride reductase A gene
VOC – volatile organic compound

Table 1-5
Injection Summary

Barrier	Total No. of Injection Wells	Target EVO per Well (gallons)	Total EVO (gallons)	Total Amended Volume (gallons)	EVO/Bioaugment Start-End	Time Since Last Injection (10/28/2011)
SAB	14	476	6,664	662,600	Nov 2008-Jan 2009 (12 weeks)	142 weeks
SSB1	22	423	9,306	925,500	Feb 2009 – March 2009 (4 weeks)	136 weeks
SHB3	20	545	10,980	1,089,000	March 2009 – Sept 2009 (25 weeks)	108 weeks
FSB2	29	370	10,730	1,067,000	Oct 2009-Nov 2009 (6 weeks)	103 weeks
FSB1	36	476	16,660	1,656,000	Dec 2009 – Feb 2010 (10 weeks)	88 weeks
SHB1	37	155 to 194	6,587	629,300	Feb 2010-March 2010 (7 weeks)	81 weeks
SATG	57	234	13,340	1,326,000	May 2010-Aug 2010 (10 weeks)	64 weeks

Acronyms/Abbreviations:
EVO = Emulsified Vegetable Oil

Table 2-1
Groundwater Level Data

Notes:
* existing monitoring well added in 2009 for sampling
** Depth to groundwater was remeasured on 9/14/2009 to check the accuracy of the previously reported depth
[a] - groundwater levels for wells MW-70-27 and MW-70-28 were measured on 8/21/08, since the wells were not accessible during the 8/18/08 measurement events

Acronyms/Abbreviations:
bgs - below ground surface
MSL - mean sea level
NA - not available
TOC - top of casing

Acronyms/Abbreviations:
°C – degrees Celsius
DO – dissolved oxygen
S/m – Siemens per meter
mg/L – milligrams per liter
mV – millivolt
NTU – nephelometric turbidity unit
ORP – oxidation-reduction potential
pH – potential of hydrogen
* out of instrument's range

Notes:

(D) - Duplicate Sample
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not analyzed
qPCR - Quantitation Polymerase Chain Reaction
U - not detected
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
*(26-36) Well Screen Interval - feet below ground surface

METHANE	RSK175	µg/L	NA	NA	NA	NA	NA

Notes:
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.

*(20-30) Well Screen Interval - feet below ground surface
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not anaylzed
U - not detected

Notes:
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
*(70-80) Well Screen Interval - feet below ground surface
D - duplicate sample
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not analyzed
qPCR - quantation polymerase chain reaction
U - not detected

Notes:
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
*(70-80) Well Screen Interval - feet below ground surface
D - duplicate sample
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
NA - not analyzed
qPCR - Quantitative Polymerase Chain Reaction
U - not detected

Notes:
*(70-80) Well Screen Interval - feet below ground surface
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
(D) - Duplicate Sample
J - estimated value
µg/L - microgram per liter
mg/L milligrams per liter
MTBE - Methyl Tertiary Butyl Ether
NA - not analyzed
qPCR - Quantitation Polymerase Chain Reaction
U - not detected

Notes:
*(115-125) Well Screen Interval - feet below ground surface
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
D - duplicate sample
J - estimated value
µg/L - micrograms per liter
mg /L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not analyzed
qPCR - quantitation polymerase chain reaction
U - not detected

SV-70-12	1.0 U	28,000

Notes:

ppmV - parts per million by volume

U - not detected

Table 4-1
Quality Assurance/Quality Control Summary

Data Quality Indicators	Measurement Performance Criteria	2010 Performance Monitoring
Accuracy	Percent recoveries for MS/MSD Criteria Varies by compound	All data was considered accurate. Two analytes were qualified due to MS/MSD. All samples met accuracy criteria except: 1) Arsenic in MS for IW-70-SHB113-125, IW-70-FSB216-132, MW-70-PMW11B-139, and MW-70-PMW12B-142, final result received a 'J' qualifier.
Precision	RPD between duplicate results ≤25 percent	Overall precision was good. No data was rejected. All samples met RPD goal except: 1) Propionate in MW-70-PMW13A-153, MW-70-PMW13B-154, MW-70-PMW14A-155, and MW-70-PMW14B-156. These samples were J flagged due to the RPDs. It is likely that matrix interference was responsible for RPDs being out or range.
Completeness	95 percent completeness	Completeness was 100 percent. No samples were rejected.
Comparability	Qualitative	Standard methods, units and reporting formats met comparability requirements per the QA/QC program.
Representativeness	DQO parameters and proper sampling techniques	DQO parameters and analytical parameters meet QA/QC program requirements.

Acronyms/Abbreviations:
- DQO – data quality objectives
- EISB – Enhanced *In-Situ* Bioremediation
- MS/MSD – matrix spike/matrix spike duplicate
- QA/QC – quality assurance, quality control
- RPD – relative percent difference

Notes:

— - not analyzed
A - annual sampling event
Anions/TDAlkalinity - Anions (EPA Method 300.0)/TDS (EPA Method 2540C)/Dissolved Metals (EPA Method 6010B)/Alkalinity (EPA Method 2320B)
DHC/vcrA - Polymerase Chain Reaction Assay (Dehalococcoides/vinyl chloride reductase gene)
DHGs - dissolved hydrogen gases (RSK 175)
dissolved metals - iron, manganese, and arsenic
FP - field parameter (pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, and turbidity)
sulfide - total dissolved hydrogen sulfide (EPA Method 4500 S2F)
SV - Soil Vapor samples analyzed for hydrogen sulfide (ASTM D5504) and methane(25C)
TOC - total organic carbon (EPA Method 5310B)
VFAs- volatile fatty acids (300.0M)
VOCs - volatile organic compounds (EPA Method 8260B)

LEGEND

- MW-70-MNA15 3.7 — SECOND SAND MONITORING WELL SHOWING WELL ID AND VINYL CHLORIDE CONCENTRATION (ug/L) IN FALL 2011
- MW-70-36 0.50 U — SECOND SAND POC MONITORING WELL SHOWING WELL ID AND VINYL CHLORIDE CONCENTRATION (ug/L) IN FALL 2011
- BIOBARRIER OR SOURCE AREA TREATMENT WELL
- IR SITE 70 BOUNDARY
- BASE BOUNDARY
- ROAD
- RAILROAD TRACK
- BUILDING
- 5 — APPROXIMATE VINYL CHLORIDE CONCENTRATION CONTOUR (ug/L)

NOTES:

(D) - DUPLICATE SAMPLE
J - ESTIMATED VALUE
NA - NOT ANALYZED
NE - NOT ESTABLISHED
ug/L - MICROGRAMS PER LITER
U - ANALYTE NOT DETECTED ABOVE THE DETECTION LIMIT: ASSOCIATED VALUE IS THE DETECTION LIMIT

[0.61] - NOT CONTOURED DUE TO DIFFERENCE IN SCREEN INTERVAL

(150 - 170) - WELL SCREEN INTERVAL, IN FEET BELOW GROUND SURFACE

BOLDED **RED** PARAMETERS ARE CONSTITUENTS OF CONCERN THAT EXCEED THE TARGET CLEANUP GOAL

Naval Weapons Station Seal Beach, California

Project No: 4-77101

Navy Contract No.: N62473-09-D-2610 (DO No.: 0006)

Sampled By:: ANDREW E., MEHDI S.

Date: 10/31/11

PURGE VOLUME CALCULATION (Volume of Discharge Tubing + Bladder Volume):

H - Length of discharge tubing	90'
D - Diameter of discharge tubing (inches)	0.375
TV - Volume of tubing (mL) [TV (mL) = 155 X D^2H]	1961.71
BV - Bladder volume (mL)	300
Sampling system volume (mL) [SSV = TV + BV]	2.26

PURGE METHOD

☐ Bailer – Type: _____ ☑ Pump – Type: QED Dedicated Bladder Pump

FIELD PARAMETER MEASUREMENT

Time	Depth to Water (feet)	Flow Rate (mL/min)	Purge Volume (Liters)	pH	Conductivity (~~µs/cm~~) S/m	Turbidity (NTU)	D.O. (mg/L)	Temp (° C)	ORP (mV)	Comments (Well condition, Color, Clarity, Odor, PID & Gas Meter Readings)

• ON QED WELL CAP THE NIPPLE FOR THE AIR HOSE IS CRACKED & LEAKS AIR. THE AIR LINE WAS CUT IN AN ATTEMPT TO USE OUR AIR LINE QUICK CONNECT NIPPLE, BUT THE QUICK CONNECT IS NOT GRABBING THE AIR LINE. IT COULD JUST BE WORN DOWN & NEEDS TO BE REPLACE

PURGE METHOD

FOR A QUICK FIX WE WRAPPED AIR LINE W/ TEFLON TAPE, ITS HOLDING & WE ARE ABLE TO PURGE WELL, BUT WILL NEED TO BE FIXED.

Project No: 4-77101

Navy Contract No.: N62473-09-D-2610 (DO No.: 0006)

Sampled By:: CHASE B. ANDREW C.

Date: 08/02/11

PURGE VOLUME CALCULATION (Volume of Discharge Tubing + Bladder Volume):

H - Length of discharge tubing	90'
D - Diameter of discharge tubing (inches)	0.375
TV - Volume of tubing (mL)	12.65625
[TV (mL) = 155 X D^2H	1961.71875
BV - Bladder volume (mL)	300
Sampling system volume (mL) [SSV = TV + BV]	2.26 L.

PURGE METHOD

☐ Bailer – Type: _____ ☒ Pump – Type: QED Dedicated Bladder Pump

FIELD PARAMETER MEASUREMENT

NOTICE: Turn-around-time (TAT) for samples shall not begin untill all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

NOTICE: Turn-around-time (TAT) for samples shall not begin untill all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

NOTICE: Turn-around-time (TAT) for samples shall not begin untill all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 09/27/11.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
MW-70-44-064	I255-01	09/27/11	WATER	VOLATILE ORGANICS BY GC/MS
IR-70-GW-TB-065	I255-02	09/27/11	WATER	VOLATILE ORGANICS BY GC/MS

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning
these results.

Sincerely yours,

Caspar J. Pang
Laboratory Director

This report is confidential and intended solely for the use of the individual or entity to whom it is addressed. This report shall not be reproduced except in full or without the written approval of EMAX.

EMAX certifies that the results included in this report meets all NELAC & DOD requirements unless noted in the Case Narrative.

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and discrepancies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associated with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11I255

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11I255

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of two (2) water samples were received on 09/27/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VO01I33L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 10/28/11.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
MW-70-02-66	J302-01	10/28/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-POC01-67	J302-02	10/28/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-35-68	J302-03	10/28/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-17-69	J302-04	10/28/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-22-70	J302-05	10/28/11	WATER	VOLATILE ORGANICS BY GC/MS
IR-70-TB-71	J302-06	10/28/11	WATER	VOLATILE ORGANICS BY GC/MS

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning these results.

Sincerely yours,

for

Caspar J. Pang
Laboratory Director

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and discrepancies ~~resolved after~~ 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associated with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11J302

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11J302

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of six (6) water samples were received on 10/28/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VO01K02L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 10/31/11.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
MW-70-11-72	J314-01	10/31/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-10-73	J314-02	10/31/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-POC03-74	J314-03	10/31/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-36-75	J314-04	10/31/11	WATER	VOLATILE ORGANICS BY GC/MS
IR-70-TB-76	J314-05	10/31/11	WATER	VOLATILE ORGANICS BY GC/MS

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning
these results.

Sincerely yours,

for

Caspar J. Pang
Laboratory Director

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11J314

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11J314

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of five (5) water samples were received on 10/31/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VO01K02L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 11/01/11.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
MW-70-23-77	K004-01	11/01/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-POC02-78	K004-02	11/01/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-POC04-79	K004-03	11/01/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-21-80	K004-04	11/01/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-16-81	K004-05	11/01/11	WATER	VOLATILE ORGANICS BY GC/MS
IR-70-TB-82	K004-06	11/01/11	WATER	VOLATILE ORGANICS BY GC/MS

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning
these results.

Sincerely yours,

for

Caspar J. Pang
Laboratory Director

COURIER/AIRBILL

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11K004

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K004

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of six (6) water samples were received on 11/01/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VO01K02L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 11/02/11.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
MW-70-MNA01-83	K014-01	11/02/11	WATER	DISSOLVED GAS
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC
MW-70-MNA03-84	K014-02	11/02/11	WATER	DISSOLVED GAS
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC
MW-70-MNA02-85	K014-03	11/02/11	WATER	DISSOLVED GAS
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC
MW-70-MNA04-86	K014-04	11/02/11	WATER	DISSOLVED GAS
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC
IR-70-TB-87	K014-05	11/02/11	WATER	VOLATILE ORGANICS BY GC/MS
MW-70-MNA05-88	K014-06	11/02/11	WATER	DISSOLVED GAS
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning
these results.

Sincerely yours,

for

Caspar J. Pang
Laboratory Director

COURIER/AIRBILL

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and discrepancies resolved after 1300 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

Ye Myint

Subject: RE: COCs for Seal Beach received today, 11/02/11

Ye,

I will verify the times for those samples. For the analyses, the analyses listed on the COC is correct. The labels are pre-printed, and so list all tests for the 1L poly bottle.

thanks,
Nick

Nick,

Attached are the logins and COCs information for SDG: 11K014. Please verify the analyses required for the samples. Please see our SFR for details. Let me know if you have any questions. Thanks.

Ye Myint

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11K014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K014

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of six (6) water samples were received on 11/02/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for VO01K03L/C were all within QC limits.
Percent recoveries for VO01K05L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD RSK-175
DISSOLVED GASES

SDG#: 11K014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K014

METHOD RSK-175
DISSOLVED GASES

A total of five (5) water samples were received on 11/02/11 for Dissolved Gas analysis, Method RSK-175 in accordance with USEPA at R.S. Kerr Environmental Research Laboratory, Ada, OK 74820 March 15, 1989.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method and was verified using a secondary source (ICV). All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for DGK001WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
DISSOLVED GASES

Client : INSIGHT EEC, INC.
Project : NWS SEAL BEACH, IR SITE 70.

SDG NO. : 11K014

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 300.0(M)
ORGANIC ACIDS

SDG#: 11K014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K014

METHOD 300.0(M)
ORGANIC ACIDS BY IC

A total of five (5) water samples were received on 11/02/11 for Organic Acids (Acetate, Butyrate, Lactate and Propionate) by IC analysis, Method 300.0(M) in accordance with Methods for the Determination of Inorganic Substances in Environmental Samples (EPA/600/R-93/100).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for OAK002WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 11/03/11.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
MW-70-PMW01A-089	K035-01	11/03/11	WATER	ANIONS BY IC
				DISSOLVED GAS
				DISSOLVED METALS BY ICP
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC
				TOTAL ORGANIC CARBON
				ALKALINITY
				TOTAL DISSOLVED SOLIDS
				DISSOLVED HYDROGEN SULFIDE
MW-70-PMW01B-091	K035-02	11/03/11	WATER	ANIONS BY IC
				DISSOLVED GAS
				DISSOLVED METALS BY ICP
				VOLATILE ORGANICS BY GC/MS
				ORGANIC ACIDS BY IC
				TOTAL ORGANIC CARBON
				ALKALINITY
				TOTAL DISSOLVED SOLIDS
				DISSOLVED HYDROGEN SULFIDE
MW-70-27-092	K035-03	11/03/11	WATER	ANIONS BY IC

NOTICE: Turn-around-time (TAT) for samples shall not begin untill all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

Subject: RE: Samples received today (11/03/11) -11K035

Those require both 300 (anions) and 300.0M (VFAs). I abbreviated it on the label since there was no room. It should be listed as a separate test on the COC. I'll let the field crew know to change it.

thanks,
Nick

Subject: Samples received today (11/03/11) -11K035

Nick,

Please verify the analyses requested on the COCs especially the request for 300.0/M. I'm not sure if you need both Anions and organic acids by this method. Could you instruct the field team to specify the parameters required by the method to minimize the confusion on future COCs.

Thanks.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11K035

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of six (6) water samples were received on 11/03/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied except for Acetone in CV001J3116 was not within 20% of expected value (biased high). However, analyte was not one of analytes required dilution in associated diluted samples. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, three (3) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Three (3) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for V001K12L/C were all within QC limits.
Percent recoveries for V001K14L/C were all within QC limits.
Percent recoveries for V001K15L/C were all within QC limits.

Matrix QC Sample
A set of MS/MSD was analyzed with the samples in this SDG.
Percent recoveries for K035-02M/S were within project QC limits.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

VOLATILE ORGANIC INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: EMAX Inc
Lab Code: EMXT Case No.:
Lab File ID: RJV596
Instrument ID: TQ01
GC Column:RTX502.2ID:0.32mm (mm)

Contract: NWS SEAL BEACH, IR SITE 70.
SAS No.: SDG No.: 11K035
BFB Injection Date : 10/31/11
BFB Injection Time : 09:18
Heated Purge: (Y/N) N

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	24.79
75	30.0 - 60.0% of mass 95	51.84
95	Base peak, 100% relative abundance	100.00
96	5.0 - 9.0% of mass 95	6.73
173	Less than 2.0% of mass 174	0.00(0.0)1
174	Greater than 50% of mass 95	73.40
175	5.0 - 9.0% of mass 174	5.20(7.1)1
176	95.0 - 101.0% of mass 174	72.01(98.1)1
177	5.0 - 9.0% of mass 176	4.99(6.9)2

1-Value is % mass 174 2-Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD,BLANKS, AND STANDARDS:

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD RSK-175
DISSOLVED GASES

SDG#: 11K035

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD RSK-175
DISSOLVED GASES

A total of five (5) water samples were received on 11/03/11 for Dissolved Gas analysis, Method RSK-175 in accordance with USEPA at R.S. Kerr Environmental Research Laboratory, Ada, OK 74820 March 15, 1989.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method and was verified using a secondary source (ICV). All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for DGK003WL/C were all within QC limits.

Matrix QC Sample
A set of MS/MSD was analyzed with the samples in this SDG.
Percent recoveries were within project QC limits except for results qualified with [*] in K035-02 M/S summary form, most likely due to matrix interference. Check QC summary form for details. Methane recovery was out of QC limits due to high concentration of the parent sample.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
DISSOLVED GASES

Client : INSIGHT EEC, INC.
Project : NWS SEAL BEACH, IR SITE 70.

SDG NO. : 11K035
Instrument ID : GCT010

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 3010A/6010B
DISSOLVED METALS BY TRACE ICP

SDG#: 11K035

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 3010A/6010B
DISSOLVED METALS BY TRACE ICP

A total of five (5) water samples were received on 11/03/11 for Dissolved Metals by ICP analysis, Method 3010A/6010B in accordance with Department of Defense Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source. Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria. MRL was analyzed as required by the project.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for IPK026WL/C were all within QC limits.

Matrix QC Sample
Matrix QC sample was analyzed at the frequency prescribed by the project.
Percent recoveries for K035-02M/S were within project QC limits.
In addition, analytical spike and serial dilution were analyzed for matrix interference evaluation. Results were within method acceptance criteria.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

WET CHEMICAL ANALYSES

SDG#: 11K035

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 300.0
ANIONS BY IC

A total of five (5) water samples were received on 11/03/11 for Anions (Chloride, Nitrate, Nitrite and Sulfate) by IC analysis, Method 300.0 in accordance with Methods for the Determination of Inorganic Substances in Environmental Samples (EPA/600/R-93/100).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. Results were compliant to project requirement.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for ICK015WL/C were all within QC limits.
Percent recoveries for ICK017WL/C were all within QC limits.

Matrix QC Sample
Matrix QC sample were analyzed at the frequency prescribed by the project. Percent recoveries were within project QC limits except for one for Chloride result qualified with [*] in K035-02 M/S summary form, most likely due to matrix interference. Check QC summary form for details. Sample duplicate were also analyzed with the samples. RPDs were within project limit.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter. Samples K035-01, -02, -03, -04 and -05 were analyzed at 2x dilution for Nitrate due to strong odor and turbidity and at various dilutions for Nitrite due to interference from high Chloride concentration.

ANALYTICAL LOGS

EMAX LABORATORIES, INC.

ANALYSIS RUN LOG
for
ION CHROMATOGRAPHY

Note: For samples and relevant QCs/Standards analyzed, refer to attached analytical sequence.

Comments:

Concentrations of:

S_1 — 0.05 ppm
S_2 — 0.1
S_3 — 0.2
S_4 — 0.5
S_5 — 1.0
S_6 — 2.0
S_7 — 5.0
S_8 — 10.0
S_9 — 20.0

Linearity (ppm)

F^- — 5
Cl^- — 20
NO_2N — 10
Br^- — 5
NO_3N — 5
PO_4P — 5
SO_4^{2-} — 20

Column: Metrosep A Supp 5-100

Flow Rate: 0.70 ml/min

IC Eluent:

SW4-01-213 (320 mM Na_2CO_3 / 100 mM $NaHCO_3$) 20 ml - 2 L

IC Regenerant:

SW4-01-220 (1000 mM H_2SO_4) 100 ml - 1 L

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 300.0(M)
ORGANIC ACIDS BY IC

A total of five (5) water samples were received on 11/03/11 for Organic Acids (Acetate, Butyrate, Lactate and Propionate) by IC analysis, Method 300.0(M) in accordance with Methods for the Determination of Inorganic Substances in Environmental Samples (EPA/600/R-93/100).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary forms for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for OAK004WL/C were all within QC limits.
Percent recoveries for OAK006WL/C were all within QC limits.

Matrix QC Sample
Matrix QC sample were analyzed at the frequency prescribed by the project.
Percent recovery for K035-02M was within project QC limits.
Sample duplicate were also analyzed with the samples. RPDs were within project limit.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

ANALYTICAL LOGS

EMAX LABORATORIES, INC.

ANALYSIS RUN LOG
for
ION CHROMATOGRAPHY

Note: For samples and relevant QCs/Standards analyzed, refer to attached analytical sequence.

Comments:

Eluent : 60 mM NaOH: (60 ml - 2L) SW4-01-209

0AD6I26.met : 300M ICAL → Passed.

- Linear Range:

S-0: 0.0 ppm S-3: 1.0 ppm

S-1: 0.1 ppm S-4: 2.0 ppm

S-2: 0.5 ppm S-5: 3.0 ppm

- ICV: 2 ppm
- Sample Loop: 25 µL
- Flow Rate: 1.50 mL/min
- Suppressor : ASRS 4mm
- SRS Current: 100 mA
- Column : Ion Pac AS11 HC, 4x 250 mm
- Guard Column : IonPac AG16; 4x 250 mm

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 2320B
TOTAL ALKALINITY

A total of five (5) water samples were received on 11/03/11 for Alkalinity analysis, Method 2320B in accordance with Methods for the Chemical Analysis of Water and Wastes (MCAWW) (EPA/600/4-79/020).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for ALK005WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG. However, sample duplicate was analyzed with the samples. RPD was within project limit.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 2540C
TOTAL DISSOLVED SOLIDS

A total of five (5) water samples were received on 11/03/11 for Total Dissolved Solids analysis, Method 2540C in accordance with Standard Methods for the Examination of Water and Wastewater, 20th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Balance calibration was checked as prescribed by the method. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for TDK005WL/C were all within QC limits.

Matrix QC Sample
Sample duplicate was analyzed with the samples in this SDG. RPD was within project limit.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD 4500F
DISSOLVED HYDROGEN SULFIDE

A total of five (5) water samples were received on 11/03/11 for Dissolved Hydrogen Sulfide analysis, Method 4500F in accordance with Standard Methods for the Examination of Water and Wastewater, 20th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Matrix QC Sample
No matrix QC sample was designated for this SDG. However, sample duplicate was analyzed with the samples. RPD was within project limit.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

METHOD 4500F

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K035

METHOD SM5310B
TOC

A total of five (5) water samples were received on 11/03/11 for Total Organic Carbon analysis, Method SM5310B in accordance with Standard Methods for the Examination of Water and Wastewater, 18th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary forms for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for TCK005WL/C were all within QC limits.
Percent recoveries for TCK006WL/C were all within QC limits.

Matrix QC Sample
Matrix QC sample was analyzed at the frequency prescribed by the project.
Percent recoveries for K035-02M/S were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter. Sample K035-01 was filtered prior to analysis due to its turbidity.

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 11K063

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 11K063

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of seven (7) water samples were received on 11/07/11 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with DoD Quality Systems Manual for Environmental Laboratories, Version 4.1.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, three (3) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Three (3) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for VO01K14L/C were all within QC limits.
Percent recoveries for VO01K16L/C were all within QC limits.
Percent recoveries for VO01K20L/C were all within QC limits.

Matrix QC Sample
A set of MS/MSD was analyzed with the samples in this SDG.
Percent recoveries for K063-02M/S were within project QC limits.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.
