EXECUTIVE SUMMARY

This Performance Monitoring Report (PMR) presents the results of activities associated with the installation and monitoring of the Enhanced *In-Situ* Bioremediation (EISB) at Installation Restoration (IR) Program Site 70 (Research, Testing, and Evaluation [RT&E] Area), at Naval Weapons Station (NAVWPNSTA) Seal Beach, Seal Beach, California (Figure 1-1), which is being implemented to treat elevated levels of trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), and vinyl chloride (VC). This PMR has been prepared on behalf of Naval Facilities Engineering Command Southwest (NAVFAC SW) under Contract No. N68711-04-D-1107, Delivery Order No. 0014.

The remediation at IR Site 70 is being conducted under the IR Program. NAVWPNSTA Seal Beach is an active federal facility and is not on the National Priorities List. The lead federal agency is the Department of the Navy. The California Environmental Protection Agency, the (California) Department of Toxic Substances Control, and the (California) Regional Water Quality Control Board (RWQCB) Santa Ana Region are the state regulatory agencies providing support and oversight.

The EISB remediation activities are being conducted in accordance with the technical and functional requirements specified in the Remedial Action Work Plan (RAWP) (ECC/Geosyntec 2008a). Injection of emulsified vegetable oil (EVO) and *Dehalococcoides* (Dhc) bacteria in the form of the KB-1® culture have been injected into the source area and into 6 downgradient biobarriers. The source area treatment grid and the 6 biobarriers treat contaminants of concern in 4 hydrostratigraphic zones including the Upper Fines, First Sand, Second Sand, and Shell Horizon.

Installation of these amendments in the Source Area Biobarrier (SAB), Second Sand Biobarrier-1 (SSB-1), and Shell Horizon Biobarrier-3 (SHB-3) was completed in 2009. Installation activities and associated performance monitoring results at these biobarriers are described in the 2009 PMR (Insight 2010).

EISB injections that were performed during the period documented in this PMR, between November 2009 and December 2010, were performed in the following sequence:

1. First Sand Biobarrier-2 (FSB-2) - completed on November 24, 2009
2. First Sand Biobarrier-1 (FSB-1) - completed on February 12, 2010
3. Shell Horizon Biobarrier-1 (SHB-1) - completed on April 7, 2010
4. Source Area Treatment Grid (SATG) - completed on August 3, 2010

In addition to the injection of the EVO and KB-1® amendments, a number of field activities were performed between November 2009 and December 2010, to support the installation of the biobarriers, to evaluate the performance of the newly installed biobarriers and to evaluate the

overall efficacy of the remedy. These field activities were performed as established in the Standard Operating Procedures (SOPs) contained in Attachment B-2 of the Sampling and Analysis Plan (SAP). Specific activities included the following:

- Twenty-three SATG injection wells were constructed in May 2010 to support the injection of the EISB amendments in the SATG, following completion of the Environmental Security Technology Certification Program (ESTCP) project in that area.
- Groundwater elevations were measured in 74 groundwater monitoring wells. Results are used to update the site conceptual model, ensure that the installation of the biobarriers are not adversely impacting groundwater flow, and to confirm that the biobarriers are placed to intersect the dissolved phase plume.
- Groundwater samples were collected from 86 groundwater monitoring wells (74 monitoring and 12 injection), which included monthly and semi-annual periodic performance monitoring in addition to the annual monitoring event. Groundwater samples were analyzed for volatile organic compounds (VOCs), dissolved hydrocarbon gases (DHGs), volatile fatty acids (VFAs), anions, total dissolved solids (TDS), alkalinity, total organic carbon (TOC), dissolved hydrogen sulfide, dissolved metals, and Dhc with VC reductase A gene (*vcr*A) (Table 1-1). The results are used to evaluate the performance of the remedy and update the conceptual design for the site.
- Field parameters (groundwater temperature, pH, dissolved oxygen [DO], oxidation-reduction potential [ORP], specific conductance, turbidity), and depth to water, were measured as part of the performance monitoring for the EISB activities, per the schedule outlined in Table 1-1, to ensure that the remedy is performing according to design. The data also provide important lines of evidence for determining if and when further injection of amendments will be required.
- Twelve soil vapor probes were sampled and ambient air was monitored for methane and hydrogen sulfide. These chemicals are byproducts of EISB and indicate that bioremediation is occurring. These compounds can be hazardous at elevated concentrations and must be closely monitored.

The EISB field activities at the SATG were performed last, in order to ensure that the IR Site 70 remediation activities do not interfere with the ESTCP demonstration project performed by Camp, Dresser, and McKee (CDM) in the area, which was completed in December 2009.

The data from the performance monitoring event was used to develop recommendations for future EISB activities in the different hydrostratigraphic zones. Review of the performance monitoring data indicates that that EISB activities in all 4 hydrostratigraphic zones and 7 biobarrier areas, are promoting reductive dechlorination to VC and ethene.

Multiple lines of evidence were evaluated and support that EISB is working effectively at the biobarrier areas at IR Site 70. The remedy performance is summarized as follows:

- DO and ORP values measured during and after injection activities in the biobarriers and in downgradient performance monitoring wells indicate anaerobic and strongly reducing conditions. These conditions are expected to continue to provide the prerequisite conditions to promote degradation of the chlorinated ethenes at the site.
- Although a significant drop in pH was observed during injection of the amendments, in most areas, the pH is gradually returning to baseline conditions. Low pH (i.e. <5.5) could adversely impact the ability of the Dhc bacteria to dechlorinate the chlorinated ethenes.
- A significant reduction of total moles of all contaminants of concern (COCs) is observed in all the biobarriers, which provides one line of evidence that conversion of TCE to DCE to VC to ethene and ethane is occurring.
- In general, within the biobarrier wells, TCE concentrations reported as part of the baseline monitoring in 2008 were converted to cis-1,2-DCE soon after the installation of the biobarriers, and continued conversion to ethene is occurring.
- TOC concentrations were high in the biobarrier wells soon after injection activities and TOC concentrations have generally increased above 100 milligrams per liter (mg/L) in most biobarriers. However, TOC concentrations have decreased in biobarriers SAB and SSB-1, which were installed during the first half of 2009.
- VFAs increased in all the biobarriers soon after injection. During subsequent monitoring events, concentrations of VFAs decreased suggesting that they are being consumed by the microbes in the biobarriers.
- Increased concentrations of DHGs, particularly methane and ethene, were evident in all of the biobarriers and is supporting evidence that methanogenesis is occurring as a result of the EISB.
- Moderate to optimum concentrations (10^7 cells/Liter) of Dhc and *vcr*A were measured in all the biobarriers, indicating microbial activity is present for further biodegradation. The concentration of Dhc remains in the moderate to optimal range in several of the downgradient performance monitoring wells such as MW-70-PMW03A (SAB), MW-70-PMW05A and MW-70-PMW05B (FSB-1), MW-70-PMW08A and MW-70-PMW08B (FSB-2), MW-70-PMW12A and MW-70-PMW12B (SHB-3), and MW-70-PMW14A and MW-70-PMW14B (SSB-1). However, in SHB-1, where EISB was completed in April 2010, Dhc was not yet reported in the downgradient performance monitoring well MW-70-PMW10 during the Fall of 2010 sampling. The lack of Dhc reported in MW-70-PMW10 is not unexpected since there may not have been sufficient time for amended water to reach MW-70-PMW10.

The CSM was updated to provide an analysis and visualization of both the subsurface hydrogeology and dissolved phase plume morphologies. The highlights of the CSM update for the 2010 PMR are summarized as follows:

- Groundwater elevations have increased approximately 6 feet in all hydrostratigraphic zones since 2009, which may be attributable to an increase in rainfall in Water Year 2010. Hydraulic gradients and directions remain similar to 2009. Groundwater monitoring data does not indicate that the injection of the biobarriers has impacted groundwater flow.
- The updated extent of the 250 micrograms per liter (µg/L) plume for TCE was simulated using EarthVision in two- and three-dimensions and demonstrates that the post-EISB dissolved plume has decreased in width, length and vertical distribution compared to the baseline CSM.
- The dissolved phase plume remains within the point of compliance (POC) boundary.
- The lateral extent of the 250 µg/L TCE plume in the Second Sand is generally wider than originally anticipated per the Remedial Design (Geosyntec 2006b). The addition of well MW-70-14 to the Second Sand monitoring program in 2009, allowed characterization of the northeastern portion of the dissolved plume.
- The toe of the Second Sand plume, located downgradient of SSB-1, appears to be expanding to the south and southeast, based on increased concentrations of COCs in MW-70-MNA16, MW-70-MNA-17, and MW-70-15.

Based on the results of the 2010 PMR at IR Site 70, the following recommendations are made:

1. Due to the lateral extent of TCE concentrations in the Second Sand well MW-70-14, it is recommended that a Second Sand monitoring well, screened in the lower portion of the Second Sand, be installed downgradient of MW-70-14, and to the north/northeast of the SSB-1 (See Figure 4-20 for proposed location).
2. Due to the increased TCE concentrations in the toe of the dissolved COC plume in the Second Sand, this area will need to be monitored closely to ensure that amended water is effectively dechlorinating the Second Sand downgradient of the SSB-1. Pending results of COCs in the Second Sand during the next monitoring period, additional injection wells in the Second Sand may be considered.
3. It is not anticipated that additional EVO and/or KB-1® is required during 2011. However, additional assessment will be made at the next annual groundwater monitoring event by reviewing all lines of evidence including possible increases in ORP and DO, and changes in concentrations of chlorinated ethenes, Dhc/*vcr*A, TOC, and VFAs.
4. In First Sand Biobarrier, FSB-1, it is recommended that well RDO-4 be re-installed and monitored in 2011 to determine whether the recirculation of EVO and KB-1® between adjacent wells FSB-114 and FSB-115 in 2010 was sufficient in distributing the EVO and KB-1®, or whether additional injection in RDO-4 is required.

5. Since methane can accumulate in the subsurface and migrate to the surface, continued monitoring of methane in the vapor points and monitoring at the surface is recommended. Special care (venting, explosion-proof meters, etc.) must be taken prior to any sampling or intrusive activities in this area to minimize the risk of fire or explosion. A methane monitoring plan has been put in place to ensure that onsite workers are protected.
6. The data presented in the 2010 PMR support the remedial action goals for IR Site 70 (Geosyntec 2006a) and demonstrate the remedial action is reducing the contaminant concentrations at IR Site 70. The frequency of the groundwater monitoring at IR Site 70 was affected by the continuing resolution of the federal government in early 2011. The Navy will conduct a quarterly monitoring event between the next two sampling events: July 2011 and October 2011, as proposed in Table 6-1. The data acquired during this quarterly event, will be evaluated to determine the next frequency of groundwater monitoring at IR Site 70 and will be presented in the 2011 PMR.

Section 1
INTRODUCTION

This Performance Monitoring Report (PMR) presents the results of injection activities for the Enhanced *In-Situ* Bioremediation (EISB) at Installation Restoration (IR) Program Site 70 (Research, Testing, and Evaluation [RT&E] Area), at Naval Weapons Station (NAVWPNSTA) Seal Beach, Seal Beach, California (Figure 1-1). The PMR has been prepared on behalf of Naval Facilities Engineering Command Southwest (NAVFAC SW) under Contract No. N68711-04-D-1107, Delivery Order No. 0014.

The remediation at IR Site 70 is being conducted under the IR Program. NAVWPNSTA Seal Beach is an active federal facility and is not on the National Priorities List. The lead federal agency is the Department of the Navy. The California Environmental Protection Agency, the (California) Department of Toxic Substances Control, and the (California) Regional Water Quality Control Board (RWQCB) Santa Ana Region are the state regulatory agencies providing support and oversight.

NAVFAC SW directs the remedial action in accordance with requirements of the Comprehensive Environmental Response, Compensation, and Liability Act and the National Oil and Hazardous Substances Pollution Contingency Plan. The Final Remedial Action Work Plan (RAWP) defines the site-specific requirements for implementation of EISB at IR Site 70 (Environmental Chemical Corporation [ECC]/Geosyntec 2008a). The performance monitoring field activities documented in this PMR, were conducted between November 2009 and September 2010 (Table 1-1).

The EISB remediation activities are being conducted in accordance with the technical and functional requirements specified in the RAWP (ECC/Geosyntec 2008a). Field activities are being performed as established in the Standard Operating Procedures (SOPs) contained in Attachment B-2 of the Sampling and Analysis Plan (SAP). Variances to the monitoring schedule are discussed in Section 6.

The 2010 performance monitoring event documents the EISB activities performed in the Source Area Treatment Grid (SATG), First Sand Biobarrier 1 (FSB-1), First Sand Biobarrier 2 (FSB-2) and Shell Horizon Biobarrier (SHB)-1, including the following activities (Table 1-1, Figure 1-2):

- Twenty-three SATG injection wells were constructed in May 2010 as part of completion of the EISB activities in the SATG, following completion of the Environmental Security Technology Certification Program (ESTCP) project in that area. Well construction details for the new SATG wells and all wells at Site 70 are documented in Table 1-2 and Appendix F.
- Groundwater-level elevations were measured in 74 groundwater monitoring wells.

- Groundwater samples were collected from 86 groundwater monitoring wells (74 groundwater monitoring wells and 12 injection wells) and analyzed for volatile organic compounds (VOCs), dissolved hydrocarbon gases (DHGs), volatile fatty acids (VFAs), anions, total dissolved solids (TDS), alkalinity, total organic carbon (TOC), dissolved hydrogen sulfide, dissolved metals, and Dehalococcoides (Dhc) with vinyl chloride (VC) reductase A gene (*vcr*A) (Table 1-1).
- Field parameters (groundwater temperature, potential of hydrogen (pH), dissolved oxygen [DO], oxidation-reduction potential [ORP], specific conductance, turbidity) and depth to water, were measured as part of the performance monitoring for the EISB activities, per the schedule outlined in Table 1-1.
- Twelve soil vapor probes were sampled for methane and hydrogen sulfide.

The groundwater monitoring well network shown in Figure 1-2 consists of wells screened within five hydrostratigraphic units designated as: Upper Fines, First Sand, Shell Horizon, Second Sand, and Deep Sand. The monitoring well network wells were designed as follows (Geosyntec 2006b):

1) Monitored Natural Attenuation (MNA) or "sentinel" wells provide early indications of undesired plume migration and provide information with regards to attenuation of lower concentrations of trichloroethene (TCE) on the fringe of the plume;

2) Performance Monitoring Wells (PMW), located along the core of the plume between biobarriers, provide some indication of potential biobarrier operation timeframe; and

3) Point of Compliance (POC) Wells are monitored to determine if the plume is migrating off the station.

The majority of these wells were installed in 2007 during the remedial action construction phase of the project (ECC/Geosyntec 2008b) and were sampled for the first time during the baseline monitoring event in 2008. The 2010 monitoring event included analyses of samples collected from all monitoring MNA, PMW, and POC wells monitored during the 2008 baseline monitoring round (Insight 2009a) as well as injection wells that were sampled to monitor the remedy performance at the biobarriers per the schedule outlined in Table 1-1.

EISB injection at IR Site 70 began in November 2008 after the conclusion of baseline groundwater monitoring activities. To date, installation of all seven injection biobarriers have been completed with one round of injection activities. Injection activities of the biobarrier areas were performed in the following sequence:

1. Source Area Biobarrier (completed on January 30, 2009) – documented in the 2009 PMR (Insight 2010).

2. Second Sand Biobarrier 1 (completed on March 18, 2009) – documented in the 2009 PMR (Insight 2010).
3. Shell Horizon Biobarrier 3 (completed on September 25, 2009) – documented in the 2009 PMR (Insight 2010).
4. First Sand Biobarrier 2 (completed on November 24, 2009) – documented as part of this 2010 PMR.
5. First Sand Biobarrier 1 (completed on February 12, 2010) – documented as part of this 2010 PMR.
6. Shell Horizon Biobarrier 1 (completed on April 7, 2010) – documented as part of this 2010 PMR.
7. Source Area Treatment Grid (completed on August 3, 2010) – documented as part of this 2010 PMR.

The EISB field activities at the SATG was performed last, in order to ensure that the IR Site 70 remediation activities do not interfere with ESTCP demonstration project performed by Camp, Dresser, and McKee (CDM), which was completed in December 2009. The additional SATG wells (IW-70-SAT35 through IW-70-SAT57) were installed in April and May 2010 (Figure 2-1) after conclusion of injection activities at FSB-1, FSB-2 and SHB-1. Analytical methods are summarized in Table 1-1 and Section 5.

The data from the groundwater monitoring events were used to develop recommendations for future EISB activities in the different hydrostratigraphic zones.

1.1 PURPOSE

An EISB system was implemented at IR Site 70 for treatment of dense non-aqueous phase liquids (DNAPLs) and dissolved phase chlorinated solvent plumes. The EISB is a semi-passive approach comprised of biostimulation and bioaugmentation, which incorporates a grid of treatment wells in the source area and rows of injection wells that transect the dissolved phase plume, into which electron donor and bacteria are added. Emulsified vegetable oil (EVO) is used as the electron donor and injected into the wells using a recirculation approach that facilitates its distribution. In addition, injection wells receive a one-time addition of dechlorinating culture (KB-1®) capable of complete dechlorination of TCE to ethene.

The remedy design was based on the vertical and lateral extent of the 250 micrograms per liter (µg/L) TCE plume per previous monitoring results (ECC/Geosyntec 2008b, BEI 2006). Active treatment will be terminated once the TCE concentrations in groundwater are reduced to 200 µg/L. MNA will be employed after the active treatment phase until target cleanup goals (TCGs) for contaminants of concern (COCs) are achieved (Table 1-3).

Table 1-4 summarizes the components of the performance monitoring and why they are monitored. Analysis of these parameters during and after injection, ensure that the biobarriers are working as planned.

1.2 BACKGROUND

IR Site 70, also known as the RT&E Area, is located south of Westminster Boulevard and east of Seal Beach Boulevard (Figure 1-1). IR Site 70 encompasses approximately 40 acres. Groundwater at IR Site 70 is impacted by chlorinated solvents, primarily TCE and associated degradation products. Groundwater impacted by TCE extends to a depth of approximately 160 feet (ft) below ground surface (bgs) (ECC/Geosyntec 2008b; BEI 2006). The remedial approach for the site was first presented in the Revised Feasibility Study (Geosyntec 2005). Previous investigations are summarized in the RAWP (ECC/Geosyntec 2008a) and the Fifth Annual Groundwater Monitoring Report (BEI 2006). The EISB baseline results and 2009 performance monitoring of the biobarriers have been documented (Insight 2009a, 2010).

IR Site 70 consists of multi-story office and production buildings, asphalt-paved parking areas, an assortment of aboveground tanks and attendant above- and below-ground piping distribution systems, and several concrete-lined sumps. From 1962 to 1973, the National Aeronautics and Space Administration (NASA) utilized the area for the design and manufacture of the second stage of the Saturn V launch vehicle for the Apollo Program. Subsequent to NASA leaving the area, the United States Department of Energy and Garrett Engineering (Allied Signal) conducted pilot test assembly operations for a classified uranium enrichment process in portions of Building 112. The tests were conducted from 1980 to 1985 but did not include either the manufacture or enrichment of uranium. Currently, the building is used for storage, communications research, and office space.

The Final Removal Site Evaluation Report for IR Site 70 (BNI 1996) addressed potential waste from the following areas:

- Bulkhead Fabrication Building 128;
- Vertical Assembly and Hydrotest Building 112;
- Pneumatic Test, Paint, and Packaging Building 122;
- Tool and Maintenance Building 130;
- Structural Test Tower; and
- Water Conditioning Plant.

Operations at these facilities included the use of diluted acids, VOCs (including chlorinated solvents such as TCE), phenolic compounds, petroleum oils, sodium dichromate containing hexavalent chromium, detergents, metals containing paint wastes, and machine lubricating oil.

1.2.1 PHYSICAL SETTING AND SITE CONDITIONS

NAVWPNSTA Seal Beach is situated at latitude 33° 45’ 27” N and longitude 118° 4’ 22” W, San Bernardino Baseline and Meridian. NAVWPNSTA Seal Beach is located within the Los Angeles-Orange County coastal plain. Most of NAVWPNSTA Seal Beach lies in the flat alluvial deposits in the southeastern portion of the Los Angeles Basin. The Los Angeles Basin is bounded on the north by the Santa Monica Mountains, to the northeast by the Repetto and Puente Hills, to the east and southeast by the Santa Ana Mountains and the San Joaquin Hills, and to the south, southwest, and west by the Palos Verdes Hills and the Pacific Ocean. NAVWPNSTA Seal Beach slopes evenly from approximately 20 ft above mean sea level (MSL) in the northwestern part, near IR Site 70, to sea level in the tidal flats of the Seal Beach National Wildlife Refuge in the southeast (Figure 1-1, ECC/Geosyntec 2008a). The most pronounced feature at NAVWPNSTA Seal Beach is part of the Landing Hill on the southwest at a maximum elevation of 50 ft above MSL (ECC/Geosyntec 2008a).

The climate in the area is classified as a marine-influenced southern California coastal region with temperature ranges from winter lows that range from 30 degrees Fahrenheit (°F) to summer highs around 90°F. Annual precipitation is variable with an average of 12.5 inches. Precipitation data for Water Year 2010 (WY 2010), between October 2009 and September 2010, is presented in Appendix G. Prevailing winds average 4 miles per hour from the west with occasional strong dry winds (“Santa Anas”), and occur in the fall and winter. Groundwater levels are influenced by years of high precipitation or drought, as well as tidal cycles (ECC/Geosyntec 2008a).

The sequence of stratigraphic units underlying NAVWPNSTA Seal Beach from youngest (shallowest) to oldest (deepest) is:

- Recent Alluvium with a maximum thickness of approximately 80 to 100 ft bgs. The upper 50 ft consists of fine sands, silty clays, and clays; lower unit consists of sands and gravels, silty sands, silty clays, and clays.
- Upper Pleistocene Lakewood Formation is present at the site starting at depths of approximately 80 to 100 ft bgs and extending to depths of approximately 350 ft bgs, beyond the scope of the investigations at IR Site 70. Units are discontinuous and contain zones of high and low permeability (DWR 1961).
- Lower Pleistocene San Pedro Formation.
- Pliocene Pico Formation.

NAVWPNSTA Seal Beach is located in the Newport-Inglewood fault zone. Two faults, the Seal Beach fault and the Los Alamitos fault, are part of the Newport-Inglewood fault zone. The Seal Beach fault is located in the southern portion of the Newport-Inglewood fault zone. On the station, the Seal Beach fault has uplifted Upper Pleistocene deposits at Landing Hill and Hog Island (JEG 1995). Movement along the fault appears to not have displaced recent sediments.

The Los Alamitos fault lies parallel to the Seal Beach fault and about 2.25 miles northeast of the Alamitos Gap (Appendix H).

1.2.2 SITE SPECIFIC HYDROGEOLOGY

NAVWPNSTA Seal Beach is located at the southwestern corner of the Orange County Basin. The Orange County Basin contains the Artesia, Gage, Hollydale, Jefferson, Lynwood, and Silverado aquifers. The Lynwood and Silverado aquifers are merged across most of the station (JEG 1995).

There are four general aquifer zones identified at NAVWPSTA Seal Beach and include (JEG 1995):

- a semi-perched, unconfined zone within the upper Recent alluvial deposits;
- a confined fresh groundwater zone contained in lower Recent alluvial deposits;
- Late and Early Pleistocene deposits of the Lakewood and San Pedro formations, respectively, and in some parts, deposits of the Late Pliocene Pico Formation; and
- a confined zone of saline water underlying the freshwater zone.

The shallow groundwater underlying NAVWPNSTA Seal Beach (upper Recent Alluvium deposits) is within the Lower Santa Ana River Basin (Orange County management zone) (RWQCB 1995, with Amendment R8-2004-001 2004). Beneficial uses of groundwater within the Orange County management zone include municipal and domestic supply, agricultural supply, industrial service supply, and industrial process supply. Shallow groundwater underlying IR Site 70 does not serve as a water source for any of the beneficial uses designated in the Water Quality Control Plan, Santa Ana River Basin (Basin Plan) (RWQCB 1995).

The principal freshwater body (lower Recent Alluvium deposits and Upper Pleistocene Lakewood Formation) is a large confined aquifer occupying two zones. The first zone is approximately 75 to 200 ft deep and saline. The second zone is approximately 250 to 1,000 ft deep and freshwater. This second zone is the primary water supply source for neighboring cities. Groundwater levels in this principal freshwater zone fluctuate from year to year due to variations in pumping, infiltration, and recharge. Recharge to this aquifer is primarily from unconfined areas upgradient and from unlined rivers that are hydraulically connected to the aquifer. Seasonal variations occur with highs in the wet winter months and lows in the dry summer months when large quantities of water are used for irrigation (JEG 1995).

The six hydrostratigraphic units presented in the Final Technical Memorandum (ECC/Geosyntec 2008b) are:

1. **Upper Fines Unit (ground surface to approximately 60 ft bgs).** The Upper Fines Unit comprises three zones: a) a shallow zone of surficial soils and recent clayey sediments; b) an intermediate zone of interbedded silts, clays, and sandy silts and clays that include a semi-perched zone; and c) a lower zone of interbedded silts, clays, and fine- to coarse-

grained, silty to clayey sands. A zone of organic material, mainly wood chips, was encountered in a number of boreholes at a depth of approximately 45 to 50 ft bgs.

2. **First Sand Unit (approximately 60 to 105 ft bgs).** The First Sand Unit consists of poorly-graded, fine-grained sands and silty sands. A coarse sand/fine gravel layer was encountered in several borings between 80 and 95 ft bgs. This coarse layer lies just above or slightly within the underlying Shell Horizon Unit. The First Sand Unit varies in thickness from approximately 30 to 50 ft.

3. **Shell Horizon Unit (approximately 105 to 135 ft bgs).** The Shell Horizon Unit is characterized by a sequence of interbedded clays, silts, sands, and gravels with laterally discontinuous interbeds of dense shells and shell fragments. This unit is characterized by a sequence of interbedded clays, silts, sands, and gravels below the source area grading to predominantly fine grained sand in the vicinity of remedial design optimization (RDO) wells RDO-6A and RDO-6B between 1st and 2nd Street (Figure 2-3) in the dissolved-phase plume area. This unit has been subdivided into the Shell Horizon (interbedded clays) and Shell Horizon (fine-grained sands) to reflect differences in the hydrogeologic characteristics and potential plume migration behavior. Shell and gravel layers were encountered in some but not all borings, comprising interbeds within the Shell Horizon Unit that do not appear to be spatially extensive. Wood chips were encountered in several borings at a depth of about 110 ft bgs.

4. **Second Sand Unit (approximately 135 to 170 ft bgs).** Similar in character to the First Sand Unit, however, this deeper unit appears to be slightly coarser in its upper section.

5. **Deep Clay Unit (approximately 170 to 190 ft bgs).** The Deep Clay Unit consists of an upper clay to silty clay horizon and an underlying clayey silt, silt, sandy silt, or sandy clay layer. The upper clay to silty clay horizon appears to be a continuous low-permeability unit that is encountered at depths ranging between 164 to 176 ft bgs. The upper clay to silty clay unit grades downward to clayey silt, silt, sandy silt, or sandy clay. This underlying layer is 3 to 20 ft thick, extending to depths of 175 to 188 ft bgs. Below the clayey silt, silt, sandy silt, or sandy clay layer is a silty sand and sand layer, up to 6 ft thick, which has been found to a depth of 191 ft bgs in extended removal site evaluation borings at NAVWPNSTA Seal Beach.

6. **Deep Sand Unit (approximately 190 ft bgs and below).** The Deep Sand Units, where encountered, consists of variable sands (i.e., fine-grained sands and silty sands) and appears to be similar in character to the First and Second Sand Units.

1.2.3 NATURE AND EXTENT OF CONTAMINATION

The nature and extent of contamination at IR Site 70 is based on previous and current groundwater and soil investigations at IR Site 70 as well as the baseline groundwater monitoring report, and formed the basis of the current EISB design (BEI 2006; BEI 2002; Geosyntec 2006b; Insight 2009a).

Groundwater contamination at IR Site 70 may be described in two distinct areas:

(i) A source area, located between 0 to 60 feet bgs in the Upper Fines unit, with suspected residual DNAPLs, and dissolved TCE concentrations exceeding 1,000 μg/L; and

(ii) A dissolved-phase VOC plume extending downgradient in a south-southeasterly direction from the source area.

The principal COC in the dissolved-phase plume is TCE. The areal extent of the dissolved TCE plume in groundwater, prior to implementation of the EISB, was approximately 4,000 ft by 1,200 ft, with vertical migration to depths of approximately 160 ft bgs. The water table is approximately 20 ft bgs, although it can be shallower in wetter years (Insight 2009a; BEI 2006). The dissolved-phase plume is identified in the following three hydrostratigraphic units; a) the First Sand Unit (60 to 105 ft bgs), b) the Shell Horizon Unit (105 to 135 ft bgs), and c) the Second Sand Unit (135 to 170 ft bgs). The results of the 2010 EISB monitoring of groundwater documents the change in the size of the original dissolved TCE plume as described in Section 4.

The TCE plume morphology is consistent with the previous conceptual site models (CSMs) for IR Site 70 (Insight 2009a; ECC/Geosyntec 2008b), where the termination of the fine-grained horizons causes a downward "stair casing" of the TCE plume. The CSM has been updated to reflect the new morphology of the plume as a result of the active EISB remediation activities (Section 4).

1.3 REPORT ORGANIZATION

This PMR is organized as follows:

- Section 2 summarizes fieldwork activities, background, and strategies during the EISB implementation,
- Section 3 presents remedy performance and the results of groundwater quality monitoring,
- Section 4 presents the conceptual site model update and the results of the soil gas survey monitoring,
- Section 5 presents variances from the work plan and Quality Assurance (QA)/Quality Control (QC) Summary,
- Section 6 presents the summary and recommendations,
- Section 7 lists the references utilized in this report,
- Appendix A presents field sample collection and purge logs,
- Appendix B presents chain of custody documentation,
- Appendix C presents laboratory analytical results,
- Appendix D presents laboratory data validation reports and summary of the QC results,
- Appendix E presents the database export of analytical results,
- Appendix F presents SATG well construction logs and survey report,

- Appendix G presents PMR plume maps,
- Appendix H presents Orange County Well Information, precipitation data from Long Beach Airport and the Alamitos Barrier Injection Project Map, and
- Appendix I presents injection volumes and parameter data.
- Appendix J presents the regulatory agency comments and responses.

Notes:

A - Field parameter and on-site analysis
B - Volatile organic compounds (EPA Method 8260B)
C - Dissolved hydrogen gases (RSK 175)
D - Includes one or more of the following: Anions (EPA Method 300.0)/TDS (EPA Method 2540C)/Dissolved Metals (EPA Method 6010B)/Alkalinity (EPA Method 2320B)
E - Volatile Fatty acids (300.0M)
F - Total Organic Carbon (EPA Method 5310B)
G - Polymerase Chain Reaction Assay (Dehalococcoides/vinyl chloride reductase A)
H - includes Dissolved Hydrogen Sulfide (EPA Method 4500F)
I - 1,4-dioxane (EPA Method 8270C)
J - Quarterly sampling frequency listed in Remedial Action Work Plan
V - Soil Vapor samples collected and analyzed for hydrogen sulfide (ASTM D5504) and methane(25C)
* - Part of monthly and semi-annual (Periodic) Performance Monitoring; the August 2010 semi-annual is combined with the 2010 Annual
** - Wells sampled twice during the months of December 2008 and January 2010: IW-70-SAB09 (December 10 and 23); IW-70-SAB11 (December 10 and 22), IW-70-SAB12 (December 9 and 22), and IW-70-SAB14 (December 9 and 23); IW-70-SAB03 (January 6 and 16th); IW-70-SAB06 (January 5 and 16)
— - not sampled

Field Parameters - pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, and turbidity
Onsite Analyses - alkalinity, sulfide, sulfate, Iron (total), nitrate
Offsite Laboratory Analyses - A through I listed above
Grey shaded area indicates that the biobarrier had not been implemented

Acronyms/Abbreviations:
- bgs - below ground surface
- MSL - mean sea level
- NM - not measured
- NAD83 - North American Datum of 1983
- NGVD29 - National Geodetic Vertical Datum of 1929
- TOC - top of casing

Table 1-3
Contaminants of Concern and Target Cleanup Goals

Contaminant of Concern	Exposure Rate	Receptor(s)	Target Cleanup Goal (µg/L)
Chloroform	Ingestion	Future residential groundwater users	100
1,1-Dichloroethene	Ingestion	Future residential groundwater users	6
cis-1,2-Dichloroethene	Ingestion	Future residential groundwater users	6
trans-1,2-Dichloroethene	Ingestion	Future residential groundwater users	10
Tetrachloroethene	Ingestion	Future residential groundwater users	5
Trichloroethene	Ingestion	Future residential groundwater users	5
Vinyl Chloride	Ingestion	Future residential groundwater users	0.5

Source: ECC/Geosyntec (2008a) – Remedial Action Work Plan. Target Cleanup Goals are based on Applicable or Relevant and Appropriate Requirements. Reevaluation of the Target Cleanup Goals may be required at a future date, per trends in remedial performance.

Note:
µg/L – micrograms per liter

Table 1-4
Summary of Performance Monitoring Rationale

Measurement	Primary Purpose
Groundwater elevations	Ensure barriers are not impacting groundwater flow direction
VOCs	Monitor changes in plume size/location
VOCs and Dhcs	Evaluate remedial performance
Geochemistry (DO, ORP, pH, nitrate, sulfate, ferrous iron)	Determine conditions are present for Dhc survival and proliferation
TOC and VFAs	Determine distribution of EVO
qPCR (Dhc and *vcr*A)	Track growth and distribution of Dhc in groundwater
Dissolved metals	Evaluate impacts to groundwater quality

Acronyms/Abbreviations:

Dhc – *Dehalococcoides*
DO – dissolved oxygen
EVO – emulsified vegetable oil
ORP – oxidation-reduced potential
pH – potential of hydrogen
qPCR – quantitation polymerase chain reaction
TOC – total organic carbon
VFA – volatile fatty acid
*vcr*A – vinyl chloride reductase A gene
VOC – volatile organic compound

Section 2
ENHANCED *IN-SITU* BIOREMEDIATION IMPLEMENTATION

Implementation of an EISB system at IR Site 70 began in November 2008 after the conclusion of baseline groundwater monitoring activities for treatment of DNAPL and dissolved phase chlorinated solvent plumes. The 2009 PMR documents the EISB remediation activities that were completed at the Source Area Biobarrier (SAB), SSB-1, and SHB-3 (Figure 1-1; Insight 2010). This report documents the activities associated with the EISB implementation at FSB-2, FSB-1, SHB-1 and SATG, the locations of which are shown in Figures 2-1 through 2-3; Figures 2-6 through 2-17. The EISB remediation activities were conducted in accordance with the technical and functional requirements specified in the RAWP (ECC/Geosyntec 2008a). Field activities are being performed as established in the SOPs contained in Attachment B-2 of the SAP. Variances to the monitoring schedule are discussed in Section 6. Performance monitoring was also conducted in the SAB, SHB-3, and SSB-1, where EISB was completed in 2009 per the schedule summarized in Table 1-1 (Figures 2-3 through 2-5). Field parameter monitoring after injection indicate that pH, DO, and ORP have stabilized in all these biobarriers (Figures 2-18 through 2-23). The discussion of the remedy performance for these biobarriers is summarized in Section 3.

2.1 EISB IMPLEMENTATION METHODOLOGY

The EISB is a semi-passive approach comprised of biostimulation and bioaugmentation, which incorporates a grid of treatment wells in the source area and rows of injection wells that transect the dissolved phase plume, into which electron donor and bacteria are added. EVO (Newman Zone™) is used as the electron donor and injected into the wells using a recirculation approach that facilitates its distribution. In addition, injection wells receive a one-time addition of a KB-1® capable of complete dechlorination of TCE to ethene.

A mobile injection system that could be moved easily between biobarriers was used. The system consisted of a box truck that contained the injection pump, mixing equipment, and flow meters and valves. The EVO was supplied in a 6,000-gallon airtight tank contained on a separate trailer, which was delivered from the vendor prior to beginning the injections at each location.

The general approach for the EISB injection activities consisted of extracting groundwater from a group of wells (typically 10) using submersible pumps. The wells were connected through a manifold containing a series of valves and flow measuring devices. EVO was dosed into the extracted groundwater stream at the process control truck through an airtight line and was well mixed via an in-line mixer to form an emulsion of one percent EVO by volume. The flow rate of EVO was measured using a digital flow meter/totalizer. The amended groundwater was split into multiple streams and was injected into a second group of wells (typically 10 wells arranged in an alternating pattern with the extraction wells). The flow rate and pressure of each stream was carefully monitored and controlled inside the trailer using a combination of pressure gauges, flow control valves, and digital flow meter/totalizers.

Eighty percent of the EVO target volume was injected into each of the wells[1] followed by injection of the KB-1® culture. Addition of the KB-1® culture was performed as detailed in the KB-1® injection procedure (see SOPs), which involves flanking injection of the culture with anoxic groundwater (350 to 640 gallon total volume) as well as purging residual oxygen from the well with argon prior to injecting the KB-1® culture. After introducing the KB-1® and anoxic water, the remaining 20 percent of the target volume of EVO was injected into the wells, which helped to further distribute the KB-1® into the formation.

Prior to injecting EVO and KB-1® at each biobarrier, groundwater elevations were measured and baseline groundwater samples were collected for measurement of field parameters (DO, ORP, pH, conductivity, turbidity, and temperature) to determine aquifer conditions at each biobarrier immediately prior to injecting the EVO and KB-1® and to compare conditions during and after injection of the amendments (Table 1-4).

The EISB implementation activities performed at SATG, FSB-1, FSB-2, and SHB-1 are described in the following sections and were performed in the following sequence:

- First Sand Biobarrier-2 (completed on November 24, 2009);
- First Sand Biobarrier-1 (completed on February 12, 2010);
- Shell Horizon Biobarrier-1 (completed on April 7, 2010); and
- Source Area Treatment Grid (completed on August 3, 2010).

A summary of the volume of EVO injected and volume of KB-1® injected for the EISB implementation as part of the 2010 PMR is presented in Tables 2-1 through 2-4. Figures showing the locations of the injection wells associated with each biobarrier are provided in Figures 2-1 through 2-5. A summary of injection volumes and field parameter monitoring during the EISB activities for each of the hydrostratigraphic zones is presented in Figures 2-6 through 2-9. Detailed data from the injection activities and associated field parameters is presented in Appendix I.

2.2 EISB IMPLEMENTATION AT SOURCE AREA TREATMENT GRID

The EISB injection activities were performed at the SATG between May 26, 2010 and August 3, 2010, after 23 additional injection wells were installed. Well construction details and well surveying data are summarized in Table 1-2 and Appendix F. The following sections describe the field activities and field parameter monitoring during the EISB implementation activities at the SATG.

[1] A study was performed at the SAB which indicated that operational benefits could be realized by injecting the majority of the EVO prior to injecting the bacterial culture (Insight 2010).

2.2.1 INJECTION WELLS INSTALLATION IN THE SATG

The remedial design and RAWP for the EISB implementation at the SATG required 57 injection wells in the Source Area (Geosyntec 2006b; ECC/Geosyntec 2008a). Twenty-three of the 57 injection well installations were installed as part of the 2010 field activities, after the completion of the ESTCP demonstration project, performed by CDM, in the SATG area in December 2009.

The 23 injection wells (IW-70-SAT35 through IW-70-SAT57, Figure 2-1) were installed from April 12 through May 18, 2010 per the RAWP and associated SOPs (ECC/Geosyntec 2008a). Well Construction details are summarized in Table 1-2. Lithologic logs, well construction diagrams, and a civil survey report are included in Appendix F.

2.2.2 SUMMARY OF APPROACH IN THE SATG

The approach utilized for installing the SATG consisted of injecting 80 percent of the EVO target volume, followed by injecting the KB-1®, and then the remaining 20 percent of the EVO.

To facilitate EVO injection across the fifty-seven single screen wells comprising the SATG, the wells were divided into three sections, Section 1, Section 2, and Section 3, as shown in the Figure 2-1. Each section was further divided into two groups, Group 1 and Group 2 (Table 2-1). Note that injection of the EVO and the KB-1® was completed in all of the wells within each group prior to beginning the injections into the following group.

In each of the three sections, first EVO was injected into Group 1 wells, and groundwater was extracted from Group 2 wells. Then, EVO was injected into Group 2 wells, and groundwater was extracted from Group 1 wells. The cumulative volume of EVO injected into the SATG wells is shown in Figure 2-6, and detailed in Appendix I. The well groupings and injection sequence differed slightly from the design presented in the RAWP (Geosyntec 2008a). The changes were made to account for small changes made to the placement of the injection wells due to aboveground obstructions and subsurface utilities as well as an effort to optimize injection and distribution of the EVO in the aquifer.

In summary, a total of 1,326,162 gallons of amended EVO and 171 liters of KB-1® culture were injected in the fifty-seven SATG wells consistent with the volumes outlined in the RAWP. The pre-KB-1® culture injection field parameters were measured during implementation of the biobarrier to ensure field parameters were within the requirements in the RAWP and that the SiREM standards were met (see Section 2.2.3). A summary of the injection/extraction quantities and flow rates are shown in Table 2-1 and detailed in Appendix I.

2.2.3 FIELD PARAMETER MONITORING IN THE SATG

Groundwater samples were collected during injection of the EVO at a frequency of two to three times per day and analyzed for operational field parameters (i.e., DO, ORP, pH, conductivity, and temperature) using a Horiba™ Meter. Samples were collected from each line at the

extraction manifold. As shown in Table 2-5 and Figure 2-10, during the injection of amendments into the SATG (between May 26, 2010 and August 3, 2010), the DO concentrations in the extracted water remained at 0.0 milligrams per liter (mg/L) and the ORP concentrations in the extracted water decreased from -166 millivolts (mV) to -310 mV. Both DO and ORP levels maintained the conditions necessary for the KB-1® culture after bioaugmentation was performed.

The pH measured in samples collected from the extraction wells is presented in Table 2-5 and Figure 2-11. Prior to the EISB implementation injection activities at the SATG, the pH ranged from 6.44 to 7.11. During the EVO injection, the pH ranged from 6.21 to 7.00. Per the RAWP, to mitigate the potential for a decrease in pH, sodium bicarbonate (a food-grade pH-adjusting chemical) buffer solution was included in the anoxic chase water used for the KB-1® injections in all wells. Post-injection pH ranged from 4.99 to 6.72. As noted in the results of the other biobarriers where EISB was completed in 2009 (SAB, SHB-3, and SSB-1), pH is expected to recover to pre-injection levels (Figures 2-19, 2-21 and 2-23).

2.3 EISB IMPLEMENTATION AT FIRST SAND BIOBARRIER-1

The EISB injection activities were performed at the FSB-1 between December 8, 2009 and February 12, 2010. The following sections describe the approach, field activities, and field parameter monitoring associated with this biobarrier.

2.3.1 SUMMARY OF APPROACH IN THE FSB-1

The approach utilized for installing the FSB-1 consisted of injecting 80 percent of the EVO target volume, followed by injecting the KB-1®, and then the remaining 20 percent of the EVO.

To facilitate EVO injection across the thirty-five single screen wells comprising the FSB-1 (Figure 2-2), the wells were divided into four groups (Table 2-2). Note that injection of the EVO and the KB-1® was completed in all of the wells within each group prior to beginning the injections into the following group.

First, EVO was injected into Group 1 wells, and groundwater was extracted from Group 2 and Group 4 wells. Then, EVO was injected into Group 2 wells, and groundwater was extracted from Group 3 wells. Then, EVO was injected into Group 3 wells, and groundwater extracted from Group 4 wells. Finally, EVO was injected into Group 4 wells, and groundwater was extracted from Group 1 wells. The cumulative volume of EVO injected into the FSB-1 wells is shown in Figure 2-7, and detailed in Appendix I.

One of the variations to the original implementation, discussed also in Section 5, is that one of the injection wells, RDO-4 was not available for injection upon commencement of field activities. Upon field examination of the injection well RDO-4, it was found that the casing was compromised and filled with sand. A 3/4-inch pipe was used to gauge the sand thickness and depth, which could only be pushed approximately 4 feet from the top of the casing. Well RDO-4 is located between injection wells IW-70-FSB114 and IW-70-FSB115. Therefore, the target

volume (total 47,327 gallons) of EVO that was originally designed to be injected in RDO-4 well was injected into the adjacent injection well IW-70-FSB114 while continuing to extract the groundwater from IW-70-FSB115. Hence, the target EVO and KB-1® volumes for IW-70-FSB114, was doubled to maintain the total volume of injection for FSB-1.

In summary, a total of 1,656,455 gallons of amended EVO and 105 liters of KB-1® culture were injected in the thirty-five FSB-1 wells consistent with the volumes outlined in the RAWP. The pre-KB-1® culture injection field parameters were measured during implementation of the biobarrier to ensure field parameters were within the requirements in the RAWP and that the SiREM standards were met (see Section 2.3.2). A summary of the injection/extraction quantities and flow rates are shown in Table 2-2 and detailed in Appendix I.

2.3.2 FIELD PARAMETER MONITORING IN THE FSB-1

Groundwater samples were collected during injection of the EVO at a frequency of two to three times per day and analyzed for operational field parameters (i.e., DO, ORP, pH, conductivity, and temperature) using a Horiba™ Meter. Samples were collected from each line at the extraction manifold. As shown in Table 2-6 and Figure 2-12, during the EISB implementation injection activities period (between December 8, 2009 and February 12, 2010) at the FSB-1, the DO concentrations in the extracted water remained at 0.0 mg/L. During the same EISB implementation period at the FSB-1, the ORP concentrations in the extracted water decreased from -202 mV to -405 mV. Both DO and ORP levels maintained the conditions necessary for the KB-1® culture after bioaugmentation.

The pH measured in samples collected from the extraction wells is presented in Table 2-6 and Figure 2-13. Prior to adding the amendments at the FSB-1, the pH ranged from 6.40 to 7.45. Then, during injection of the EVO, the pH in Groups 1, 2, and 4 ranged from 5.91 to 6.58. In Group 3, the pH ranged from 5.58 to 5.99. Per the RAWP, in order to mitigate the decrease in pH, sodium bicarbonate (a food-grade pH-adjusting chemical) buffer solution was added to the anoxic chase water used for the KB-1® injections in all wells. Post-injection pH ranged from 5.45 to 6.98.

Water level elevations were measured in the nearby performance monitoring wells MW-70-PMW4A, MW-70-PMW4B (upgradient of the FSB-1), MW-70-PMW5A and MW-70-PMW5B (downgradient of the FSB-1) to evaluate if injection of the EVO and subsequent geochemical and biological processes would alter the natural flow of groundwater at the site. The net change in water levels in these four performance monitoring wells was about 1/100th of a foot, which indicates that there is no mounding effect due to extraction/injection activities.

2.4 EISB IMPLEMENTATION AT FIRST SAND BIOBARRIER-2

The EISB injection activities were performed at the FSB-2 between October 13, 2009 and November 24, 2009. The following sections describe the approach, field activities, and field parameter monitoring associated with this biobarrier.

2.4.1 SUMMARY OF APPROACH IN THE FSB-2

The approach utilized for installing the FSB-2 consisted of injecting 80 percent of the EVO target volume, followed by injecting the KB-1®, and then the remaining 20 percent of the EVO.

To facilitate EVO injection across the twenty-nine single screen wells comprising the FSB-2 (Figure 2-2), the wells were divided into three groups (Table 2-3). Note that injection of the EVO and the KB-1® was completed in all of the wells within each group prior to beginning the injections into the following group.

The sequence of injections in FSB-2 wells was completed with the well groupings listed in Table 2-3 and Figure 2-2 as follows: 1) EVO was injected into Group 1 wells, and groundwater was extracted from Group 2; 2) EVO was injected into Group 2 wells, and groundwater was extracted from Group 3 wells; 3) EVO was injected into Group 3 wells, and groundwater was extracted from Group 2 wells. The cumulative volume of EVO injected into the FSB-2 wells is shown in Figure 2-8, and detailed in Appendix I.

In summary, a total of 1,067,490 gallons of amended EVO and 87 liters of KB-1® culture were injected in the twenty-nine FSB-2 wells consistent with the volumes outlined in the RAWP. The pre-KB-1® culture injection field parameters were measured during implementation of the biobarrier to ensure field parameters were within the requirements in the RAWP and that the SiREM standards were met (see Section 2.4.2). A summary of the injection/extraction quantities and flow rates are shown in Table 2-3 and detailed in Appendix I.

2.4.2 FIELD PARAMETER MONITORING IN THE FSB-2

Groundwater samples were collected during injection of the EVO at a frequency of two to three times per day and analyzed for operational field parameters (i.e., DO, ORP, pH, conductivity, and temperature) using a Horiba™ Meter. Samples were collected from each line at the extraction manifold. As shown in Table 2-7 and Figure 2-14, during the EISB implementation injection activities period (between October 13, 2009 and November 24, 2009) at the FSB-2, the DO concentrations in the extracted water remained at 0.0 mg/L. During the same EISB implementation period at the FSB-2, the ORP concentrations in the extracted water decreased from -105 mV to -338 mV. Both DO and ORP levels maintained the conditions necessary for the KB-1® culture after bioaugmentation.

The pH measured in samples collected from the extraction wells is presented in Table 2-7 and Figure 2-15. Prior to the EISB implementation injection activities at the FSB-2, the pH ranged from 6.59 to 7.12. Then, during the EVO injection, the pH in Groups 1 and 2 ranged from 6.00 to 7.02. In Group 3, the pH ranged from 5.62 to 5.88 (Table 2-7 and Figure 2-15). Per the RAWP, to mitigate the decrease in pH, sodium bicarbonate (a food-grade pH-adjusting chemical) buffer solution was included in the anoxic chase water used for the KB-1® injections in all wells. Post-injection pH ranged from 5.62 to 7.49.

Water level elevations were measured in the nearby performance monitoring wells MW-70-PMW7A, MW-70-PMW7B (upgradient of the FSB-2), MW-70-PMW8A and MW-70-PMW8B (downgradient of the FSB-2), during installation of the biobarrier, to evaluate if injection of the EVO and subsequent geochemical and biological processes were altering the natural flow of groundwater at the site. The net change in water levels in these four performance monitoring wells was about 1/100th of a foot, which indicates that there was no immediate mounding effect due to extraction/injection activities. Long-term impacts to groundwater flow after the installation of the biobarrier was completed are minimal as discussed in Section 4.

2.5 EISB IMPLEMENTATION AT SHELL HORIZON BIOBARRIER-1

The EISB injection activities were performed at the SHB-1 between February 25, 2010 and April 17, 2010. The following sections describe the approach, field activities, and field parameter monitoring associated with this biobarrier (Table 2-4, Figure 2-3).

2.5.1 SUMMARY OF APPROACH IN THE SHB-1

Based on lessons learned during injection of the SHB-3, the injection strategy for SHB-1 (which contains dual screen wells like SHB-3) was modified in order to optimize the installation of this biobarrier. The SHB-1, which contains thirty-seven wells, was subdivided into two sections: one section containing 19 wells and the other section containing 18 wells (Figure 2-3). The EISB amendments were completely installed in Section 1 prior to beginning installation in Section 2. The time required from beginning to completing the injections was less than half of the time it took to install the SHB-3. The degree of biofouling was significantly less and injection rates were greater.

Similar to the procedure used during the installation of previous biobarriers, the sections were divided into two groups containing 9 or 10 wells each (Figure 2-3 and Table 2-4). Group 1 was injected into while extracting from the Group 2 wells, after which the Group 1 wells became the extraction wells and the Group 2 wells became the injection wells. Similar to installation of the previous biobarriers, 80 percent of the EVO was added, followed by the KB-1®, followed by the remaining 20 percent of the EVO.

A single flow-through packer was used in each well. The packer was placed in the blank screen located between each screened interval. Groundwater amended with EVO was pumped through the packer into the lower screen while simultaneously pumping EVO-amended water through a stinger located in the upper interval. A rigid pipe was connected through an airtight well-seal and used to introduce the amendments through the packer. The pipe also served to maintain the packer at the correct interval and minimize its movement within the well. Flow regulators and meters were utilized to ensure that the design target volume of EVO is added to each interval.

This approach offered the following advantages:

- Injection of the amendments were performed simultaneously in both the upper and lower screens; hence, the total time to install the barrier was significantly reduced compared to the time required to first inject into the lower and then into the upper screens. Shorter installation time resulted in less time available for fouling to occur.
- The packers were placed in the blank casing located between the two screen intervals and the amendments will be added through a rigid line extending through the packer. It was no longer necessary to properly align the packer screen with the well screen to achieve maximum flow.
- Since fluids were simultaneously injected into both the upper and lower screens, the pressure drop across the packer was much less compared to using the packer to inject into a single interval as was done during installation of the SHB-3. Hence, there was far less risk of the packer moving (and ejecting) from the well. Also, the rigid line, through which the amendments were added to the screen beneath the packer, helped keep the packer in place.

The SHB-1 consists of thirteen single-screen and twenty-four dual-screen injection wells, IW-70-SHB101 through IW-70-SHB137, as shown in Figure 2-3. The wells were divided in two sections and each section has two groups (Table 2-4).

Each of the SHB-1 dual-screen wells are comprised of the upper screen ranging from about 100 to 110 ft bgs and the lower ranging from 115 to 130 ft bgs. The design volume of EVO for each well was divided into two quantities, based on the ratio of the two screen lengths in a well. As an example, if 20,000 gallons of EVO were to be injected in a well and the well contained a 10-ft-long and a 15-ft-long screen interval, then 40 percent of the EVO (8,000 gallons) would be injected into the 10-ft-long screen and 60 percent (12,000 gallons would be injected into the 15-ft-long screen. Similarly, the total target KB-1® volume for each well was divided into two volumes; one for the upper screen interval and the other for the lower screen interval. Packers were used to isolate the screen intervals during injections to ensure that the amendments were injected through the appropriate screen interval.

In summary, a total of 629,307 gallons of amended EVO and 111 liters of KB-1® culture were injected in the thirty-seven SHB-1 wells consistent with the volumes outlined in the RAWP. The pre-KB-1® culture injection field parameters were measured during implementation of the biobarrier to ensure field parameters were within the requirements in the RAWP and that the SiREM standards were met (see Section 2.5.2). A summary of the injection/extraction quantities and flow rates are shown in Table 2-4 and detailed in Appendix I.

2.5.2 FIELD PARAMETER MONITORING IN THE SHB-1

Groundwater samples were collected during injection of the EVO at a frequency of two to three times per day and analyzed for operational field parameters (i.e., DO, ORP, pH, conductivity, and temperature) using a Horiba™ Meter. Samples were collected from each line at the extraction manifold. As shown in Table 2-8 and Figure 2-16, during the EISB implementation injection activities period (between February 25, 2010 and April 17, 2010) at the SHB-1, the DO

concentrations in the extracted water remained at 0.0 mg/L. During the same EISB implementation period at the SHB-1, the ORP concentrations in the extracted water decreased from -270 mV to -336 mV. Both DO and ORP levels maintained the conditions necessary for the KB-1® culture after bioaugmentation.

The pH measured in samples collected from the extraction wells is presented in Table 2-8 and Figure 2-17. Prior to the EISB implementation injection activities at the SHB-1, the pH ranged from 6.78 to 7.99. Then, during the EVO injection, the pH ranged from 5.48 to 6.07. Per the RAWP, to mitigate the decrease in pH, sodium bicarbonate (a food-grade pH-adjusting chemical) buffer solution was included in the anoxic chase water used for the KB-1® injections in all wells. Post-injection pH ranged from 6.25 to 6.37.

Water level elevations were measured in the nearby performance monitoring wells MW-70-PMW09 (upgradient of the SHB-1) and MW-70-PMW10 (downgradient of the SHB-1) to evaluate if injection of the EVO and subsequent geochemical and biological processes would alter the natural flow of groundwater at the site. The net change in water levels in these four performance monitoring wells was about 1/100th of a foot, which indicates that there is no mounding effect due to extraction/injection activities.

Table 2-4
Shell Horizon Biobarrier-1 Injection Summary

Injection Well Group	Total No. of Injection Wells	Target EVO Volume per Well (gallons)	Total EVO Volume (gallons)	Total Amended Volume (gallons)*	Total KB-1® Volume (liters)	Remarks
Shell Horizon Biobarrier-1: Consists of thirteen single-screen and twenty-four dual-screen injection wells. The wells are divided into two sections (Section 1 and Section 2) and each section has two groups (Group 1 and Group 2)						
Section 1, Group 1: IW-70-SHB101 IW-70-SHB103 IW-70-SHB105 IW-70-SHB107 IW-70-SHB109 IW-70-SHB111 IW-70-SHB113 IW-70-SHB115 IW-70-SHB117 IW-70-SHB119	10	155 to 194 (depending on the screen length of the well)	1,862	185,318	30 (3 liters per well)	Started injection in Section 1, Group 1 wells on February 25, 2010 and completed target volumes injection on March 5, 2010. Groundwater was extracted from all of the Section I, Group 2 wells. The EVO emulsion was injected at an average rate of 7 gpm and groundwater extraction rates were maintained at 9 gpm.
Section 1, Group 2: IW-70-SHB102 IW-70-SHB104 IW-70-SHB106 IW-70-SHB108 IW-70-SHB110 IW-70-SHB112 IW-70-SHB114 IW-70-SHB116 IW-70-SHB118	9	155 to 194 (depending on the screen length of the well)	1,668	166,014	27 (3 liters per well)	Started injection in Section 1, Group 2 wells on March 8, 2010 and completed target volumes injection on March 15, 2010. Groundwater was extracted from all Section I, Group 1 wells. The EVO emulsion was injected at an average rate of 7 gpm and groundwater extraction rates were maintained at 8 gpm.
Section 2, Group 1: IW-70-SHB121 IW-70-SHB123 IW-70-SHB125 IW-70-SHB127 IW-70-SHB129	9	155 to 194 (depending on the screen length of the well)	1,554	142,848	27 (3 liters per well)	Started injection in Section 2, Group 1 wells on March 18, 2010 and completed target volumes injection on March 29, 2010. Groundwater was extracted from all of the Section II, Group 2 wells. The EVO emulsion was injected at an average rate of 8 gpm and groundwater extraction

Notes:

°C - degrees Celcius
DO - dissolved oxygen
Fe - Iron
µS/cm - microSiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolt
NM - not measured
NTU - nephelometric turbidity unit
ORP - oxidation-reduction potential
pH - power of hydrogen

Notes:

°C - degrees Celcius
DO - dissolved oxygen
Fe - Iron
µS/cm - microSiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolt
NM - not measured
NTU - nephelometric turbidity unit
ORP - oxidation-reduction potential
pH - power of hydrogen
*very foul odor and thick gray matter

Notes:
°C - degrees Celcius
DO - dissolved oxygen
Fe - Iron
µS/cm - microSiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolt
NM - not measured
NTU - nephelometric turbidity unit
ORP - oxidation-reduction potential
pH - power of hydrogen

Notes:
°C - degrees Celcius
DO - dissolved oxygen
Fe - Iron
µS/cm - microSiemens per centimeter
µg/L - micrograms per liter
mg/L - milligrams per liter
mV - millivolt
NM - not measured
NTU - nephelometric turbidity unit
ORP - oxidation-reduction potential
pH - power of hydrogen

Section 3
REMEDY PERFORMANCE

Per the Remedial Design and RAWP (Geosyntec 2006b; ECC/Geosyntec 2008a), a monitoring program has been established to track the progress towards achieving the following performance criteria for the EISB remedy:

- Complete dechlorination of TCE to ethene within the biobarriers;
- Dhc growth to concentrations exceeding 10^7 cells per liter (cells/L) and migration of augmented culture throughout active treatment zones; and
- Localized and/or minimal secondary groundwater quality impacts.

Baseline monitoring was conducted for all biobarriers in August 2008. The biobarriers were installed during 2009 and 2010 and subsequently monitored. Wells upgradient, within and downgradient of the biobarrier were sampled and COC concentrations measured. Table 1-1 summarizes the biobarrier well installation dates and schedule of monitoring for each biobarrier since November 2009.

In order for complete reductive dechlorination to occur, three primary factors are required. First, the oxidation-reduction (redox) state of the aquifer must be sufficiently reducing to support the microbial community required for reductive dechlorination (e.g., dechlorinating and fermenting communities). Second, an adequate supply of electron donor must be present to maintain the reducing redox condition of the aquifer as well as provide the dechlorinating population with its preferred electron donor (i.e., molecular hydrogen). Third, an active Dhc community must be present. These primary factors are captured in the first two performance metrics. The last performance criterion is established to monitor, assess, and minimize the impact of the EISB system on secondary groundwater quality. Impacts to pH and generation of methane and hydrogen sulfide gas can influence the performance of the biobarriers as well as represent potential health and safety risks.

The groundwater monitoring program incorporates various analyses to provide the information necessary to evaluate progress towards achieving the performance criteria listed above. Performance indicators including changes in levels of VOCs, DHGs, inorganic anions, and polymerase chain reaction (PCR) assays specific to Dhc, and aquifer pH are monitored to evaluate performance and track progress toward achieving remedial goals. In addition, surrogate measures of EVO through TOC and volatile fatty acids (acetic, butyric, lactic, and propionic acids) are taken to assess the presence of the electron donor. Field measurements of groundwater elevation are being performed to optimize injection and extraction flow rates during installation of the barriers, to ensure that the barriers are not impacting the direction of groundwater flow, and to better understand and evaluate the meaning of the performance indicators discussed above.

Determining the redox state of the aquifer in the vicinity of each biobarrier is of particular importance since reductive dechlorination of the chlorinated COCs by Dhc occurs best when the environment is highly reducing. The redox state of the aquifer is best evaluated using an approach that incorporates multiple lines of evidence. Various parameters including ORP, DO, nitrate, ferrous iron, sulfate, and methane are monitored. Mildly reducing environments are anaerobic (i.e., DO is near zero) as heterotrophic bacteria utilize the oxygen in the aquifer. Other biogeochemical processes occur, which convert nitrate to nitrite, insoluble ferric iron to soluble ferrous iron, sulfate to sulfide, and carbon dioxide to methane. Hence, in addition to measuring ORP, reduction of the concentrations of DO, nitrate, and sulfate, and increases in the production of ferrous iron and methane concentrations are determined. This multiple lines of evidence approach provide a proper representation of the aquifer's redox potential.

In the following subsections, the groundwater quality for each biobarrier is discussed in terms of the above-mentioned performance metrics. Specifically, the state of aquifer geochemistry is presented and compared to conditions necessary to support reductive dechlorination. These conditions include the qualitative measurement of EVO and PCR assays specific to Dhc. The changes in COC concentrations that have resulted after the barriers were installed and the impacts of the biobarriers on the secondary groundwater quality are also discussed (Figures 3-1 through 3-14).

3.1 GROUNDWATER QUALITY

Groundwater samples were collected from eighty-six monitoring wells (Table 1-1) during the 2010 annual performance monitoring event. The wells that were sampled consisted of: sixteen SAT (Upper Fines) wells, eight SAB (First Sand) wells, fifteen FSB-1 wells including one RDO well, nine FSB-2 wells, five SHB-1 wells, eight SHB-3 wells, eleven SSB-1 wells, four Upper Fines POC wells, four First Sand POC wells, one Shell Horizon POC well and five Second Sand POC wells. These wells were selected to monitor the performance of the EISB activities conducted in the biobarriers, upgradient and downgradient of the biobarriers, and in the POC wells. Groundwater quality parameters (WQPs), which consisted of DO, ORP, pH, sulfate and alkalinity, VOCs, TOC, VFAs, DHGs, and chlorinated ethenes were monitored per the schedule outlined in Table 1-1, which included monthly and semi-annual periodic performance monitoring in addition to the annual monitoring event.

3.1.1 DISSOLVED OXYGEN, ORP, pH, SULFATE, and ALKALINITY

Water quality parameters were monitored in several wells around the biobarriers before, during, and after injection activities as discussed in Section 2 (Tables 2-5 through 2-11; Figures 2-10 through 2-23). The purpose of the WQPs was to determine if conditions were present for Dhc survival and proliferation. WQPs results for the Fall of 2010 annual sampling event are presented in Table 3-1.

Dissolved oxygen – For reductive dechlorination to work effectively (i.e., complete transformation of TCE to ethene) DO levels must be below 1 mg/L. Within all of the biobarriers, the DO concentrations were 0.00 mg/L during the 2010 performance monitoring event, which is the same as was observed during the 2009 performance monitoring event. This is ideal for the growth of anaerobic microorganisms sensitive to DO levels. However, in two outlying wells, First Sand well MW-70-43A, and First Sand POC well MW-70-16 (Figure 1-2), the DO concentrations were measured at 1.98 mg/L and 3.58 mg/L, respectively, in the Fall 2010 annual sampling event. However, neither of these wells are located in the vicinity of the biobarriers. The DO in the biobarrier wells remained at 0.00 mg/L during the monitoring periods for all the biobarriers (Figures 2-10, 2-12, 2-14, 2-16, 2-18, 2-20, and 2-22).

ORP – ORP readings are significant in determining the geochemical condition of the aquifer. In order for Dhc to survive and grow aquifer conditions should be at least in the methanogenic range, which requires the ORP to be between -100 and -300 mV or lower. ORP readings collected during the 2010 monitoring events indicated that all of the upgradient and downgradient PMWs and biobarrier wells were within this range and in some instances even ranged as low as -300 and -500 mV, which is very favorable for reductive dechlorination of TCE and its daughter products (Tables 2-5 through 2-11; 3-1; Figures 2-10, 2-12, 2-14, 2-16, 2-18, 2-20, and 2-22). This is consistent with the readings obtained during the 2009 performance monitoring event.

Higher ORP readings were measured in some wells during the Fall 2010 annual sampling event. ORP readings measured in Upper Fines wells, MW-70-MNA01 through MW-70-MNA04 (Figure 2-1), located in the Source Area, ranged from -92 mV to 35 mV. Similar ORP readings, -81 mV and -90 mV, were measured in Second Sand wells MW-70-14 and MW-70-15 (Figure 2-5), respectively, which are located at least 600 feet from the biobarrier. ORP measurements in some of the POC wells located in the Upper Fines, First Sand, Shell Horizon and Second Sand ranged from -80 mV to -91 mV, which is outside of the methanogenic range (Table 3-1). These wells are not in the immediate vicinity of the SATG and biobarriers, and therefore are expected to have higher values. The ORP readings in the SATG and biobarrier wells are shown on Figures 2-10, 2-12, 2-14, 2-16, 2-18, 2-20, and 2-22.

pH - During the 2010 performance monitoring event, pH values generally ranged from 6 to 8 within the biobarriers, the range ideal for microbial growth. There were however a few outliers. The change in pH values before, during, and after injection are documented in Tables 2-5 through 2-11 and Figures 2-11, 2-13, 2-15, 2-17, 2-19, 2-21, and 2-23. In 3 wells, pH was measured below 6 during the Fall 2010 annual monitoring event: MW-70-PMW01A and IW-70-SAT36 located within the SATG (Figure 2-1) and well IW-70-SHB310 located in the SHB-3 (Figure 2-3, Table 3-1). In one well, MW-70-43A located approximately 200 feet north of the SHB-3 (Figure 2-3), pH was measured at 11.81, which is consistent with previous monitoring. Hence, it is unlikely related to the biobarrier activities (BEI 2006; Insight 2009a).

A decrease in pH is not an uncommon observation during reductive dechlorination. It is a result of acids produced by the biodegradation process and can be observed when groundwater alkalinity drops below 300 mg/L (see below). This is currently being observed in SATG wells. SATG treatment occurred between May and August 2010. Hence during the September 2010 sampling event, pH decreased to below 6 in several SATG wells and even below 5 in one well IW-70-SAT-03 (pH = 4.99) (Table 3-1, Figure 2-11). The pH is expected to rebound by the next sampling event as was observed in the other biobarrier wells. In general, pH was observed to recover after initial injection activities (Figures 2-11, 2-13, 2-15, 2-17, 2-19, 2-21, and 2-23).

Alkalinity - Alkalinity is an indicator of the buffering capacity of the aquifer. A strong buffering capacity is important because as the EVO is used by the microorganisms, it produces VFAs that have the potential to reduce the pH of the aquifer. Additionally as chlorinated ethenes degrade, they produce hydrochloric acid that can reduce the pH of the aquifer making it less ideal for microbial growth. The alkalinity in the aquifer buffers the subsurface against pH changes. In the biobarrier wells where alkalinity was analyzed, it was generally above 200 mg/L. Alkalinity ranged in the 150 to 200 mg/L range in a few PMW wells. Within the FSB, alkalinity readings were greater than 1,000 mg/L. In wells IW-70-FSB118 and IW-70-FSB216, the alkalinity was 1,330 mg/L and 1,180 mg/L, respectively. Although a pH drop was observed in the biobarriers soon after treatment, this trend occurred to a lesser degree in the FSB-1 where alkalinity is generally higher. In most FSB-1 wells, pH remained above 6 after treatment.

3.1.2 TOTAL ORGANIC CARBON

TOC was monitored at all biobarriers during baseline and subsequent performance monitoring events (Tables 2-5 through 2-11; Tables 3-2 through 3-13). Select wells located upgradient, downgradient, and within the biobarriers were sampled to determine the effect of EVO injection. During baseline sampling, the TOC concentrations were below 3 mg/L in all of the wells monitored with most TOC concentrations in wells reported below 1 mg/L. In general, after injection of the EVO into the biobarrier wells, the TOC concentrations increased to greater than 100 mg/L. Maximum TOC concentrations measured after injection are summarized below based on a comparison of data to date (Tables 3-14 through 3-20).

Results of the Fall 2010 sampling event indicated that TOC concentrations decreased significantly in several of the biobarrier wells where TOC concentrations were noted to have increased substantially compared to the first round of performance monitoring. TOC concentration changes were specifically noted at the SAB and SSB-1, which were the first two biobarriers installed. Injection of EVO was completed in January 2009 at the SAB and March 2009 at the SSB-1. Reduction of TOC was less, if any, in the other biobarriers; however, based on the results observed in the SAB and SSB-1, TOC concentrations across the different biobarriers will need to be closely monitored. In biobarrier SHB-3, TOC concentrations increased from 1.8 mg/L during baseline sampling to 2,080 mg/L during the Fall of 2010 sampling event after the biobarrier had been installed. TOC concentrations are just one line of

evidence that the conditions are suitable for reductive dechlorination at the site. In conjunction with TOC, daughter products, redox conditions, Dhc levels, and VFAs are being monitored to assess the performance of the EISB remedy.

A comparison of the maximum TOC concentrations approximately three months after injection and during the annual Fall 2010 sampling event demonstrates that while the TOC concentrations did not increase as much in the PMWs as in the biobarrier wells, the TOC concentrations in the downgradient PMWs have decreased since peaking at three months post EVO injection. For example, in the SAB at well MW-70-PMW03A, TOC increased to 219 mg/L; in MW-70-PMW01A at the SATG TOC increased to 915 mg/L; and well MW-70-PMW12B at SHB-3, TOC increased to 27.7 mg/L. Several biobarriers (FSB-1, FSB-2, SHB-1, and SSB-1) showed little to no increase in TOC concentrations post EVO injection. The data may reflect the heterogeneous nature of the aquifer matrix in the different lithologic layers that results in an inhomogeneous distribution of the carbon source between the injection wells and the PMWs. After the TOC concentrations in the downgradient PMWs peaked, the TOC concentrations have decreased in the SAB and SHB-3. As expected, the TOC concentrations in the upgradient PMWs were not impacted by the injection of EVO into the aquifer (Tables 3-14 through 3-20).

Maximum Total Organic Carbon Concentrations

Lithologic Unit	Biobarrier	Biobarrier Completion Date	Well Identification	Initial TOC (Baseline - 2008) (mg/L)	Max TOC Concentration (mg/L)	
					~ 3 Months after Installation	Fall 2010
Upper Fines	SATG	08/3/2010	IW-70-SAT16	NM	NM	2,910
First Sand	SAB	01/30/2009	IW-70-SAB06	0.828 J	860	20.5
			IW-70-SAB11	1.7	469	177
First Sand	FSB-1	02/12/2010	IW-70-FSB108	0.656 J	186	106
	FSB-2	11/24/2009	IW-70-FSB216	1.68	468	468
Shell Horizon	SHB-1	4/7/2010	IW-70-SHB113	1.03	140	110
	SHB-3	09/25/2009	IW-70-SHB310	1.8	769	2,080
Second Sand	SSB-1	03/18/2009	IW-70-SSB109	1.28	1,110	121

Notes:

mg/L – milligrams per liter
NM – not measured

3.1.3 VOLATILE FATTY ACIDS

VFAs were monitored in select biobarrier wells and wells upgradient and downgradient of the biobarrier (Tables 3-14 through 3-20). Monitoring VFA helps to determine the distribution and use of EVO in the biobarrier and aquifer. In the wells where the highest concentrations of TOC

were detected, VFA concentrations increased. Specifically, wells IW-70-SAB06, IW-70-SHB310, IW-70-SSB109, IW-70-FSB216 and IW-70-SHB113 exhibited increased concentrations of butyrate, propionate and acetate soon after injection of the EVO. During subsequent monitoring events, the concentration of the VFAs decreased, indicating that they were being consumed by microbes in the biobarrier. In general, the concentration of VFAs in the PMWs remained below detection limits with a few exceptions. In performance monitoring well MW-70-PMW01A, located near the SATG (Figure 2-1), VFAs were above detection limit with acetate concentration being the highest at 845 mg/L. Similar spikes in acetate concentrations directly after EVO injection were observed in other biobarriers (Insight 2010). For example in MW-70-PMW03A, located downgradient of the SAB (Figure 2-4), acetate concentrations increased to 95 mg/L during the Fall 2009 sampling event and subsequently decreased to 11 mg/L during the Fall 2010 sampling event. As noted above, concentrations of VFAs are one line of evidence to assess the suitability of the aquifer to support active reductive dechlorination. These data indicate that EVO is being consumed by the fermenting population and utilized by anaerobic populations such as methanogens and dechlorinators.

3.1.4 DISSOLVED GASES

The dissolved gases methane, ethene and ethane were monitored in select biobarrier wells and performance monitoring wells. Methanogenic conditions, as evidenced by an increase in concentration of methane in groundwater, are ideal for *Dehalococcoides* growth and proliferation. During baseline sampling, methane concentrations in the wells at the site were very low ranging from 10 to 20 µg/L (Tables 3-2 through 3-13). After installation of the SAB biobarrier, methane concentrations increased by three orders of magnitude to concentrations around 14,000 µg/L, as seen in well IW-70-SAB03. A similar trend was observed in the FSB-1, FSB-2, SHB-1 SHB-3, SSB-1 biobarriers where baseline conditions showed very low methane concentrations (less than 20 µg/L), but after injection of EVO the methane concentration increased several orders of magnitude and remained elevated, as evidence by the methane concentrations measured during the Fall 2010 performance sampling event. This was also evident during SATG implementation where methane concentrations as high as 12,000 mg/L were observed in IW-70-SAT35.

In the PMWs, increases in methane concentrations in the downgradient performance wells were significant. For instance in well MW-70-PMW03A located downgradient of the SAB (Figure 2-4), methane concentrations were reported at 25,000 µg/L during the 2010 sampling event. Similar Increases in methane concentrations are observed in downgradient PMWs in all the biobarriers.

Increases in the concentrations of ethene are clear indicators that complete reductive dechlorination of TCE and its daughter products is occurring in the aquifer. Additionally, ethene can be converted to ethane by anaerobic microbes. As such ethane is monitored as an indicator of TCE degradation. During baseline sampling, ethene and ethane concentrations throughout the

plume were a maximum of 2 µg/L, which is the reporting limit for both chemicals. The greatest increases in concentrations of ethane and ethene measured during the Fall 2010 sampling event were observed at the biobarriers that had been installed in 2009. For example, ethene concentrations increased in several wells in and around the SAB. The highest ethene concentration detected in the SAB was 10 µg/L in well IW-70-SAB11 during the March 2010 sampling event although concentrations remained at 2 µg/L in several wells in this biobarrier (Appendix E). Similarly, in the SHB-3 at well IW-70-SHB310, ethene and ethane concentrations increased to as high as 20 µg/L and 6.2 µg/L, respectively.

Ethene concentrations also increased in recently installed biobarriers. For instance, in the FSB-1 and FSB-2 biobarriers, which were installed on February 2010 and November 2009 respectively, ethene concentrations increased in wells downgradient of FSB-1 (MW-70-38, MW-70-PM05B, and MW-70-MNA07) and FSB-2 (MW-70-MNA10 and MW070-PMW08B) (Tables 3-5 and 3-6; Appendix E). Similarly, ethene concentrations were observed as high as 990 µg/L in well MW-70-PMW01B within the SATG (Figure 2-1; Table 3-2). Methane increases were more limited in the SHB-1 while ethene concentrations were reported at 120 µg/L in IW-70-SHB113 (July 2010 sampling) (Figure 2-3; Table 3-8).

Overall, ethane concentrations increased in fewer wells than ethene concentrations. For instance, the highest ethane concentrations detected in the SAB was 7.6 µg/L (0.26 micromolar [µM]) in well IW-70-SAB09, whereas the greatest ethene concentration in this well was 5 µg/L (0.18 µM) and the highest concentration of ethene detected at this barrier was 10 µg/L (0.42 µM) (Figure 2-4). This is not uncommon as ethane is not a direct reductive dechlorination daughter product but rather a secondary anaerobic process.

3.2 CHLORINATED ETHENES

The performance of the SATG and the six biobarriers (SAB, FSB-1, FSB-2, SHB-1, SHB-3, and SSB-1) is discussed below based on changes in molar concentrations of chlorinated ethenes. Chlorinated ethene concentrations are presented as molar concentrations to facilitate comparison between the relative quantities of the COCs in terms of contaminant degradation as reductive dechlorination is a 1 to 1 stoichiometric conversion (i.e., for each mole of TCE degraded, one mole of dichloroethene (DCE) is produced). Graphs displaying the total molar concentrations of TCE, DCE, VC, and ethene are presented in Figures 3-1 through 3-10.

Each bar shown in Figures 3-1 through 3-10 consists of molar concentration of TCE, DCE, VC, and ethene. To facilitate comparison of changes that have occurred after the biobarriers were installed, baseline values and results obtained during the 2009 and 2010 performance monitoring events are grouped together for each well that was sampled. In Figure 3-3, molar COC concentrations are shown for the upgradient and downgradient PMWs (MW-70-PMW02A/B and MW-70-PMW03A/B) in comparison to injection well IW-70-SAB06. Figure 3-4 shows the molar COC concentrations for the SAB injection wells.

In general, within the biobarrier wells, the TCE concentrations present in the wells during baseline was converted to cis-DCE soon after installation of the biobarrier and continued conversion to ethene occurred in the biobarrier by the Fall 2010 performance monitoring event. The following bullets summarize data and observations associated with each biobarrier:

- A significant reduction of total moles of COCs was observed in the biobarriers during this performance period.
- All VOCs were removed from the SAB and FSB-1 biobarriers or are reported at concentrations below their maximum contaminant level (MCLs) with only trace concentrations of COCs being present. (Figures 3-3 through 3-6).
- In biobarrier SHB-3, during the Fall 2010 sampling event the TCE appeared to have been removed and cis-DCE was the major contaminant present in the well. This was also evident in biobarrier SHB-1 where high cis-DCE and VC concentrations remained during the Fall 2010 performance monitoring event (Figures 3-8 and 3-9). This biobarrier was installed in April 2010 so sufficient time had not elapsed for complete dechlorination of TCE to occur.
- Within the SATG, which was installed in August 2010, there is already evidence of transformation of TCE in some wells with VC reaching as high as 20 µM in well IW-70-SAT35 (Figure 2-1). Although TCE has not been completely removed from all wells in the SATG by the Fall 2010 sampling event, the formation of cis-DCE and VC soon after treatment indicates that transformation is occurring (Figures 3-1 and 3-2).

In general, the performance monitoring wells located upgradient of the biobarriers appeared not to be significantly impacted by the amendments injected into the biobarrier wells. During baseline monitoring most of the upgradient performance monitoring wells had high TCE concentrations. After the biobarriers were installed some transformation of TCE into cis-DCE was noted in these upgradient wells, but no further transformation occurred. Cis-DCE was the dominant transformation product present in the upgradient wells during the Fall 2010 monitoring event. This was evident in wells upgradient of the biobarriers SAB, FSB-1, FSB-2, SHB-1, and SHB-3. In several upgradient performance monitoring wells, TCE lingered even after installation of the biobarrier. This occurred in FSB-1 where TCE concentrations were as high as 33 µM in PMW06B (Figure 2-3) during the 2010 performance monitoring event. In SSB-1 at MW-70-PMW-13A and MW-70-PMW-13B (Figure 2-5), TCE concentrations have not decreased after installation of the biobarrier. However, at biobarrier SHB-3, even though cis-DCE persisted in some wells during the Fall 2010 sampling event, such as in well MW-70-PMW11A (Figure 2-3), ethene was the dominant chemical detected in the Fall 2010 sampling event so the amendments in the biobarrier appear to have affected that upgradient well.

The amendments added to the biobarriers appeared to have significant effect on the wells downgradient of the biobarrier, which is anticipated since the EISB amendments and contaminants of concern will travel downgradient of the barriers in the direction of groundwater flow. These observations are the primary line of evidence that the EISB remedy is functioning

as expected. Transformation of TCE to VC was evident in the FSB-2, SHB-3 and SSB-1 biobarriers by the high VC concentrations detected during the Fall 2010 sampling event. In addition, significant increases were noted in the deeper performance monitoring wells located immediately downgradient of each of these biobarriers (i.e. MW-70-PMW08B, MW-70-PMW12B, and MW-70–PMW14B).

Although the concentration of TCE appears to have decreased in the performance monitoring wells located downgradient of the biobarriers, the results of the recent performance monitoring event indicate relatively high concentrations of cis-DCE remain in the SHB-1 and SSB-1 performance monitoring wells. However, there were trace concentrations of cis-DCE and VC concentrations and increased levels of ethene present indicating complete transformation of TCE is occurring in these downgradient wells.

The PMW wells in the area of the SATG had the highest concentration of TCE remaining during the Fall 2010 sampling event with concentrations often two orders of magnitude higher than in the SATG wells. Generally, the concentrations of cis-DCE and VC detected in the PMW wells around the SATG were lower than in the SATG injection wells with a few exceptions. Well MW-70-PMW01B (Figure 2-1) had 48 µM of VC during the Fall 2010 sampling event, the highest concentration of VC detected in the area of the SATG. MW-70-PMW01A (Figure 2-1) showed transformation of TCE to cis-DCE with cis-DCE concentrations as high as 45 µM.

3.3 DEHALOCOCCOIDES DISTRIBUTION AND SURVIVABILITY

During installation of the biobarriers, a culture of KB-1® was injected into the biobarrier wells. One of the important lines of evidence indicating that the EISB remedy is functioning as designed is to confirm high concentrations of Dhc and confirm the presence of the *vcr*A gene as expression of the *vcr*A gene by the dechlorinating population has been correlated to complete reductive dechlorination. The expression (or up regulation) of the *vcr*A gene is being used to monitor the performance of the remedy and ensure that cis-DCE and VC stall does not occur.

The concentrations of Dhc and *vcr*A were monitored in performance monitoring wells located downgradient of the biobarriers and in select biobarrier wells. The results, including baseline, 2009 and 2010 performance monitoring are presented in Tables 3-21 through 3-27 and in Figures 3-11 through 3-17 for the various biobarriers.

In general in wells where Dhc and *vcr*A concentrations were above optimum (i.e. 10^7 cells/L), complete transformation to ethene was observed; however in wells where Dhc was at optimum but *vcr*A was at moderate or between moderate (10^4 to 10^7 cells/L) and optimum concentrations, complete transformation did not occur. In the SAB biobarrier, Dhc and *vcr*A were above optimum concentrations within the biobarrier, but downgradient of the biobarrier, Dhc concentrations were close to but never at optimum concentration, and *vcr*A concentrations were very low. The lack of *vcr*A in the SAB PMW well MW-70-PMW03B (Figure 2-4) is evidenced by the lingering cis-DCE concentrations in this well. In the FSB-2, concentrations of Dhc and *vcr*A in the PMWs were never at optimum concentration in any of the wells monitored, but were

both above moderate concentrations for most wells except PMW wells MW-70-MNA10 and MW-70-PMW07B (Figure 2-3). In the wells downgradient of FSB-2, which had near optimum concentrations of Dhc and *vcr*A, TCE was transformed to VC and there is evidence of further transformation by the appearance of ethene in this well. Optimum concentrations of Dhc and *vcr*A were present in the SSB biobarrier during the 2010 sampling event. This is further evidenced by the decrease in COC concentration and transformation of TCE all the way to ethene. Within the SATG, both Dhc and *vcr*A concentrations were above optimum in most of the wells sampled. Only two wells had *vcr*A concentrations below moderate concentration. In those two wells IW-70-SAT3 and IW-70-SAT16 there was evidence of transformation to VC but cis-DCE was the most dominant transformation product present, whereas in well IW-70-SAT35 where both Dhc and *vcr*A were at the highest concentration and above optimum there was evidence of both cis-DCE and VC degrading. In summary, when Dhc and *vcr*A concentrations were at or near optimum, complete transformation of the COCs was observed. If Dhc concentrations were high but *vcr*A concentrations low, cis-DCE persisted.

Abbreviations:
°C – degrees Celsius
DO – dissolved oxygen
Fe - Iron
µS/cm – microSiemens per centimeter
mg/L – milligrams per liter
mV – millivolt
NTU – nephelometric turbidity unit
ORP – oxidation-reduction potential
pH – potential of hydrogen

Notes:

(D) - Duplicate Sample
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not analyzed
ND - not detected
qPCR - Quantitation Polymerase Chain Reaction
U - not detected
UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
[a] Not detected: Sample specific quantitation limit is 4000 per liter.
[b] Correction factor applied to correct for non-specific polymerase chain reaction amplification products.
*(26-36) Well Screen Interval - feet below ground surface

Notes:

Bolded parameters are constituents of concern

*(20-30) Well Screen Interval - feet below ground surface

D - Duplicate Sample

J - estimated value

µg/L - microgram per liter

mg/L - milligrams per liter

MTBE - methyl tertiary butyl ether

NA - not anaylzed

U - not detected

UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity

Notes:
Bolded parameters are constituents of concern and bold values are above target cleanup goals or federal/state primary maximum containment limits.
*(70-80) Well Screen Interval - feet below ground surface
D - duplicate sample
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not analyzed
ND - not detected
qPCR - quantation polymerase chain reaction
U - not detected
[a] Not detected: Sample specific quantitation limit is 4000 per liter.
[b] Correction factor applied to correct for non-specific polymerase chain reaction amplification products.

Notes:
D - duplicate sample
J - estimated value
µg/L - microgram per liter
mg/L - milligrams per liter
NA - not analyzed
ND - not detected
qPCR - Quantitative Polymerase Chain Reaction
U - not detected
UJ - analyte not reported above the detection limit; the sample quantitation limit is as estimated quantity
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
*(70-80) Well Screen Interval - feet below ground surface
[a] vcrA detected but below specific quantiation limit. The sample specific quantitation limit is 4000 per liter.

Notes:
(D) - Duplicate Sample
J - estimated value
µg/L - microgram per liter
mg/L milligrams per liter
MTBE - Methyl Tertiary Butyl Ether
NA - not analyzed
ND - not detected
qPCR - Quantitation Polymerase Chain Reaction
U - not detected
UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity
*(70-80) Well Screen Interval - feet below ground surface
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
[a] Not detected: Sample specific quantition limit is 4,000 per liter.

Notes:

*(80-100) Well Screen Interval - feet below ground surface

Bolded parameters are constituents of concern

J - estimated value

µg/L - microgram per liter

mg/L - milligrams per liter

MTBE - methyl tertiary butyl ether

NA - not analyzed

U - not detected

UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity

Table 3-8

Notes:
D - duplicate sample
J - estimated value
µg/L - microgram
mg/L - milligrams per liter
MTBE - Methyl Tertiary Butyl Ether
NA - not analyzed
ND - not detected
qPCR - Quantitation Polymerase Chain Reaction
U - not detected
UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity
*(105-130) Well Screen Interval - feet below ground surface
[a] vcrA detected but below specific quantitation limit. The sample specific quantitation limit is 4000 per liter.
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.

Notes:

*(115-125) Well Screen Interval - feet below ground surface

Bold parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.

D - duplicate sample

J - estimated value

µg/L - micrograms per liter

mg /L - milligrams per liter

MTBE - methyl tertiary butyl ether

NA - not analyzed

qPCR - quantitation polymerase chain reaction

U - not detected

[a] Not detected: Sample specific quantition limit is 4,000 per liter.

Notes:
*(110-130) Well Screen Interval - feet below ground
Bolded parameters are constituents of
J - estimated value
µg/L - micrograms per liter
mg/L - milligrams per liter
MTBE - methyl tertiary butyl ether
NA - not analyzed
U - not detected
UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity

Table 3-11 (continued)

Notes:
*feet below ground level
Bolded parameters are constituents of concern and bolded values are above target cleanup goals or federal/state primary maximum contaminant limits.
D - duplicate sample
J - estimated value
µg/L - micrograms per liter
mg /L - milligrams per liter
NA - not analyzed
ND - not detected
qPCR - quantitation polymerase chain reaction
U - not detected

Table 3-12

Notes:

*(150-170) Well Screen Interval - feet below ground surface

Bolded parameters are constituents of concern and bolded values are above target cleanup goals for federal/state primary maximum contaminant limits.

J - estimated value

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - not analyzed

U - not detected

UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity

Notes:

*(190-200) Well Screen Interval - feet below ground surface

Bolded parameters are constituents of concern

J - estimated value

µg/L - microgram per liter

mg/L - milligrams per liter

NA - not analyzed

U - not detected

UJ -analyte not reported above the detection limit; the sample quantiation limit is an estimated quantity

Section 4

CONCEPTUAL SITE MODEL UPDATE

The purpose of the conceptual site model (CSM) is to provide an analysis and visualization of both the subsurface hydrogeology and dissolved-phase TCE, cis-1,2-DCE, and VC plumes morphologies, which is achieved by using both 2-D water level and plume contours and the 3-D plume visualization (generated via EarthVision). Over several CSM iterations, both the hydrogeology and the TCE contaminant spatial distribution have been improved and refined. This updated CSM provides a comprehensive understanding of the current conditions at Site 70 based on the Fall 2010 performance monitoring program (Figures 4-1 through 4-30). Specific data include:

- Water level elevation data from Fall 2010 annual groundwater monitoring event;
- Groundwater sampling results from Fall 2010. These data were input into EarthVision as a standalone data set to compare the current conditions to the baseline conditions prior to implementing the EISB system; and
- In addition to TCE, the daughter products of reductive dechlorination were incorporated into the model. Specifically, cis-1,2-DCE and VC data sets were included as part of the 2010 3D CSM visualization.

The CSM is described in the remainder of this section. The updated model is compared to the CSM that was developed using results of the baseline sampling that was performed before the EISB remedy was put in place. Changes that have occurred at the site are discussed.

4.1 LITHOLOGY

The lithology encountered during the drilling of the additional 23 new injection wells for the SATG was consistent with the lithological characterization in previous investigations. Hence, no new lithologic information was included in the 2010 performance monitoring sampling event. As such, the hydrogeology of Site 70 in the CSM was based on the August 2008 revision of the CSM generated by EarthVision. A summary of the subsurface hydrogeology is outlined below using the six separate hydrostratigraphic units as model layers. The hydrostratigraphic zones are illustrated in cross-sections Figures 4-23 and 4-24 through the Source Area and through a longitudinal cross-section through the plume in Figures 4-28 through 4-30.

Upper Fines Unit (below the fill to approximately 60 ft bgs [-48 ft msl]). The Upper Fines Unit is comprised of the following five subunits.

- **Clay 1:** The unit consists of predominantly clayey soils from below the fill to a depth of approximately 20 ft bgs [-8 ft msl] (i.e., “surficial fines”);
- **Sand 1:** Starting approximately at a depth of 20 ft bgs [-8 ft msl], a predominantly fine-grained sand is intercepted that ranges in thickness from 2 to 17 ft thick (i.e., “20 ft sand”);

- **Clay 2:** Starting approximately at a depth of 30 to 38 ft bgs [-18 to -26 ft mal], a predominantly clayey unit is intercepted that ranges in thickness from approximately 3 to 10 ft thick (i.e., "30 ft fines");
- **Sand 2:** Starting at a depth of 38 to 57 ft bgs [-26 to -45 ft msl], a fine- to medium-grained sand unit is intercepted that ranges in thickness from 13 to 20 ft thick (i.e., "40 ft sand"); and
- **Clay 3:** Starting at a depth of approximately 57 to 60 ft bgs [-45 to -48 ft msl], a silty clay to clay layer is intercepted that ranges in thickness from 2 to 3 ft thick (i.e., "60 ft clay").

- **First Sand Unit (approximately 60 to 105 ft bgs [-48 to -93 ft msl]).** The First Sand Unit consists of interbedded fine-grained and medium-grained sands and silty sands. A coarse sand/fine gravel layer was encountered in several borings between 80 and 95 ft bgs [-68 to -83 ft msl], and localized clays layers were noted between 80 to 90 ft bgs [-68 to -88 ft msl] in several SAB injection wells. The First Sand Unit varies in thickness from approximately 30 to 50 ft.
- **Shell Horizon Unit (approximately 105 to 135 ft bgs [-93 to -123 ft msl]).** The Shell Horizon Unit is consists a sequence of inter bedded clays, silts, sands, and gravels with laterally discontinuous interbeds of dense shells and shell fragments. In the source area, this unit is comprised of a sequence of interbedded clays, silts, sands, and gravels. The unit transitions to predominantly fine grained sand near RDO well RDO-6A/B between First and Second Streets in the dissolved-phase plume area. Within the CSM, the Shell Horizon has been subdivided into the Shell Horizon Clays (interbedded) and Shell Horizon Sand (fine-grained) to reflect differences in the hydrogeologic characteristics and potential plume migration behavior.
- **Second Sand Unit (approximately 135 to 170 ft bgs [-123 to -158 ft msl]).** Similar in character to the First Sand Unit, however, this lower unit appears to be slightly coarser in its upper section.
- **Deep Clay Unit (approximately 170 to 190 ft bgs).** The Deep Clay Unit consists of upper clay to silty clay horizon and an underlying clayey silt, silt, sandy silt, or sandy clay layer. The upper clay to silty clay horizon appears to be a continuous low-permeability unit that is encountered at depths ranging between 164 to 176 ft bgs. The upper clay to silty clay unit grades downward to clayey silt, silt, sandy silt, or sandy clay. This underlying layer is 3 to 20 ft thick, extending to depths of 175 to 188 ft bgs. Below the clayey silt, silt, sandy silt, or sandy clay layer is a silty sand and sand layer, up to 6 feet thick, which has been found to a depth of 191 ft bgs in extended removal site evaluation (ERSE) borings at NAVWPNSTA Seal Beach.
- **Deep Sand Unit (approximately 190 ft bgs and below).** The Deep Sand Units has fine-grained sands and silty sands and appears to be similar in character to the First and Second Sand Units. It should be noted that the Deep Sand Unit has been logged in only a few boreholes on NAVWPNSTA Seal Beach (BEI 2002).

4.2 GROUNDWATER FLOW AND DIRECTION

Groundwater levels were measured in 74 wells on August 25, 2010 (Table 4-1). The horizontal hydraulic gradient and flow direction were determined for each of the five defined hydrostratigraphic units: Upper Fines, First Sand, Shell Horizon, Second Sand, and Deep Sand. Water level elevation contour maps that denote these gradients and flow direction for each of the units are depicted in Figures 4-1 through 4-5.

Potential external factors that may influence local horizontal and vertical gradients and groundwater flow direction include the groundwater pumping (regional and agricultural water supply wells) and aquifer recharge (e.g., Alamitos Injection Barrier) activities. Groundwater pumping and aquifer recharge in the Orange County Groundwater Basin causes significant temporal fluctuations in the local groundwater elevations (Geosyntec 2006b). Specifically, variability in the groundwater behavior at IR Site 70 may be caused by changes in operation of the Alamitos Injection Barrier. The Alamitos Injection Barrier, located to the northwest of IR Site 70 (Appendix G), is operated jointly by Los Angeles County Department of Public Works, the Water Replenishment District of Southern California, and the Orange County Water District (OCWD) as a hydraulic barrier to seawater intrusion. This barrier includes the injection of fresh water at depths as shallow as 27 ft bgs (Geosyntec 2006b). The closest injection well is approximately 2,000 feet northwest of IR Site 70.

OCWD well production data from municipal and agricultural wells located within a 2-mile radius of IR Site 70 were reviewed to determine the possible influence of production wells on IR Site 70 water levels (Appendix G). In addition, precipitation data from 2010 for the Long Beach airport was reviewed to determine the influence of precipitation on the water levels and is presented in Appendix G. Water levels have risen up to 6 feet in most wells since the baseline water level measurements in 2008. One of the influences may be higher than normal rain fall in Water Year (WY) 2010. The annual precipitation totals for WY 2010 was 15.66 inches for the Long Beach area, compared to 9.44 inches in WY 2009 (Insight 2009a and Insight 2010).

4.2.1 UPPER FINES GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in thirteen Upper Fines monitoring wells on August 25, 2010. The Upper Fines is the shallowest hydrostratigraphic unit defined from ground surface to approximately 60 ft bgs (Tables 1-2 and 4-1; Figure 4-1).

Groundwater elevations in the Upper Fines baseline monitoring wells ranged from 1.64 ft below MSL in well MW-70-22 to 8.72 ft below MSL in well MW-70-28. Depth to water ranged from 11.85 ft in well MW-70-22 to 17.02 ft in well MW-70-28 (Table 4-1; Figure 4-1).

The direction of groundwater flow in August 2010 was to the south/southwest in the Source Area Treatment wells towards a groundwater “low” and northwest in the vicinity of the Source Area Treatment wells. Comparison of historical data shows similar patterns (BEI 2006). Horizontal hydraulic gradients in the Upper Fines Unit ranged from approximately 0.002 foot/foot (ft/ft), in

the area southeast of Kitts Highway to 0.005 foot/foot in the area northwest of Kitts Highway (Figure 4-1).

The variable groundwater direction and horizontal hydraulic gradients observed in the Upper Fines Unit is consistent with previous investigations to date. An old stream drainage system may be traced from the area due north of IR Site 70, north of Westminster Boulevard, trending southwest through the current location of IR Site 70, subparallel to the current drainage channel that ultimately flows into Anaheim Bay (BEI 2006). The old drainage system is currently covered with structures at IR Site 70. Previous investigations attribute the variable direction and gradients in the shallowest zone to the presence of the old drainage system (BEI 2006). In addition, a review of the OCWD municipal and agricultural data suggests that injection wells in the area west of IR Site 70, part of the Alamitos Injection Barrier Project, may be influencing the water levels in the shallowest Upper Fines Unit (Appendix G).

4.2.2 FIRST SAND GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in thirty-three First Sand monitoring wells on August 25, 2010. The First Sand hydrostratigraphic unit is defined from approximately 60 to 105 ft bgs (Table 4-1; Figure 4-2). The First Sand monitoring wells are further defined spatially based on their proximity to each of the First Sand Biobarriers (FSB): SAB-1, FSB-1, and FSB-2 (Tables 1-2 and 4-1, Figure 4-2).

Groundwater elevations in the First Sand baseline monitoring wells ranged from 8.62 ft below MSL in well MW-70-POC01 to 14.23 ft below MSL in well MW-70-16. Depth to water ranged from 13.58 ft in well MW-70-MNA06 to 24.20 ft in well MW-70-43 (Table 4-1). Four First Sand wells including MW-70-PMW07A, MW-70-PMW08B, MW-70-MNA09 and IW-70-FSB216 were not contoured, which is generally consistent with the 2009 baseline monitoring results (Insight 2010). These wells are screened in the shallower portion of the First Sand between 64 and 75 ft bgs, and show higher water level elevations (Tables 1-2 and 4-1; Figure 4-2).

The direction of groundwater flow in the First Sand hydrostratigraphic unit in August 2010 was to the south/southeast, consistent with previous monitoring results (Insight 2009a; Insight 2010; BEI 2006). Horizontal hydraulic gradients in the First Sand ranged from 0.001 to 0.01 ft/ft. The steeper horizontal hydraulic gradients are observed directly east of Kitts Highway and west of 3rd Street. Shallower horizontal hydraulic gradients are observed northwest of Kitts Highway and east of 3rd Street, consistent with the 2010 baseline monitoring results (Figure 4-2; Insight 2009a). The upward vertical gradient between the Shell Horizon and First Sand Unit in the area of MW-70-MNA12 is also consistent with previous groundwater monitoring results (BEI 2006; Insight 2009a; Insight 2010).

4.2.3 SHELL HORIZON GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in twelve Shell Horizon monitoring wells on August 25, 2010. The Shell Horizon hydrostratigraphic unit is defined from approximately 105 to 135 ft bgs. The Shell Horizon monitoring wells are further defined spatially based on their proximity to each of the Shell Horizon Biobarriers: SHB-1 and SHB-3 (Tables 1-2 and 4-1, Figure 4-3).

Groundwater elevations in the Shell Horizon monitoring wells ranged from 12.51 ft below MSL in well IW-70-SHB113 to 14.88 ft below MSL in well MW-70-23. Depth to water ranged from 19.29 ft in well MW-70-PMW10 to 26.05 ft in well MW-70-23 (Table 3-1, Figure 4-3).

The direction of groundwater flow in the Shell Horizon hydrostratigraphic unit in August 2010 was to the southeast, consistent with previous monitoring results (Insight 2010). The horizontal hydraulic gradient in the Shell Horizon was approximately 0.002 ft/ft (Figure 4-3).

4.2.4 SECOND SAND GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in thirteen Second Sand monitoring wells on August 25, 2010. The Second Sand hydrostratigraphic unit is defined from approximately 135 to 170 ft bgs. The Second Sand monitoring wells are further defined spatially based on their proximity to the Second Sand Biobarrier: SSB-1 (Tables 1-2 and 4-1, Figure 4-4).

Groundwater elevations in the Second Sand monitoring wells ranged from 12.46 ft below MSL in well MW-70-PMW14A to 16.40 ft below MSL in well MW-70-21. Depth to water ranged from 18.97 ft bgs in well MW-70-MNA15 to 24.25 ft bgs in well MW-70-43B (Table 4-1). Due to differences in elevation in comparison to the remainder of the wells in the Second Sand the following wells were not contoured: MW-70-43B, MW-70-MNA15, MW-70-MNA17, and IW-70-SSB109 (Tables 1-2 an 4-1, Figure 4-4). The differences in the elevations in these wells may be due to a combination of local lithologic differences in the Second Sand as well as some differences in screen intervals. Well MW-70-43B is screened slightly shallower between 136 to 146 ft bgs. IW-70-SSB109 is screened over a greater interval, between 126 to 166 ft bgs. Well MW-70-MNA17 is screened between 140 and 150 feet bgs. Although data from wells IW-70-SSB109 and MW-70-MNA17 were consistent with other wells and were contoured during the 2008 baseline monitoring, the differences in elevation in 2009 and 2010 may be due to localized effects from the injection and therefore, were not included in the contours in this report.

The direction of groundwater flow in the Second Sand hydrostratigraphic unit in August 2010 was to the southeast, consistent with previous monitoring results (BEI 2006; Insight 2009a; Insight 2010). The horizontal hydraulic gradient in the Second Sand was approximately 0.002 ft/ft, also generally consistent with the 2009 baseline results (Figure 4-4).

4.2.5 DEEP SAND GROUNDWATER ELEVATIONS

Groundwater level elevations were measured in three Deep Sand POC wells on August 25, 2010. The Deep Sand hydrostratigraphic unit is defined as depths greater than 190 ft bgs (Tables 1-2 and 4-1, Figure 4-5).

Groundwater elevations in the Deep Sand POC wells ranged from 12.70 ft below MSL in well MW-70-POC03 to 17.58 ft below MSL in well MW-70-POC04. Depth to water ranged from 22.34 ft bgs in well MW-70-POC03 to 26.08 ft bgs in well MW-70-POC04 (Table 4-1).

The direction of groundwater flow in the Deep Sand hydrostratigraphic unit in August 2010 was to the east/southeast, consistent with August 2009 monitoring (Figure 4-5). The direction of groundwater flow in the Deep Sand during the baseline monitoring performed in August 2008, was to the northeast, and interpreted to have been influenced by municipal and agricultural production wells north and east of the site. Review of the OCWD well information for the surrounding area indicates that the influence of municipal and agricultural wells resulted in increase of up to 7 feet of groundwater throughout the IR Site 70 (Appendix G).

The horizontal hydraulic gradient in the Deep Sand in August 2010 was approximately 0.002 ft/ft, consistent with the horizontal hydraulic gradient of 0.002 ft/ft, measured during the baseline monitoring in 2008 (Insight 2009a, 2010).

4.2.6 SUMMARY OF GROUNDWATER FLOW AND DIRECTION

Hydraulic directions and gradients in the hydrostratigraphic units have been generally consistent with previous investigations (Appendix F; Insight 2009a, 2010; BEI 2006; Geosyntec 2006b). Groundwater elevations ranged from 1.64 ft below MSL in Upper Fines POC well MW-70-22 to 17.58 in the Deep Sand POC well MW-70-POC04. Horizontal hydraulic gradients ranged from 0.001 to 0.005 foot per foot.

The vertical head difference between hydrogeologic units indicates generally downward vertical gradients of groundwater flow throughout the plume and source areas between the Upper Fines, First Sand, Shell Horizons, Second Sand and Deep zones. This is consistent with previous observations (Appendix F; Insight 2009a, Insight 2010, Geosyntec 2006b).

4.3 CONTAMINANTS OF CONCERN IN GROUNDWATER

This section discusses the COCs in relation to the TCGs (Table 1-3) in each of the hydrostratigraphic zones based on the groundwater monitoring results during the annual Fall 2010 sampling event (Tables 3-2 through 3-13; Table 4-2; Figures 4-6 through 4-18). The most recent analytical results are compared to the 2008 baseline event to demonstrate the transformation of the dissolved plume since the EISB implementation. In addition, the overall projected 250 µg/L dissolved TCE plume is evaluated and compared to the extent of the cis-1,2-DCE and VC plumes to update the CSM with respect to the dissolved plume at IR Site 70 during the Fall 2010 annual performance monitoring. Baseline groundwater monitoring plume maps are presented in Appendix G.

4.3.1 UPPER FINES CONTAMINANTS OF CONCERN

Groundwater samples were collected from sixteen Upper Fines SATG wells and 4 Upper Fines POC wells (MW-70-02, MW-70-10, MW-70-17 and MW-70-22) during the Fall 2010 annual groundwater monitoring event (Tables 3-2 and 3-3). Concentration contours showing TCE, cis-1,2-DCE and VC in the Upper Fines in the Fall 2010 groundwater monitoring event at the Target Cleanup Goals are depicted in Figures 4-6 through 4-8.

A comparison of concentrations of TCE, 1,2-DCE (cis- and trans-) and VC reported in the Upper Fines performance monitoring wells in the 2008 baseline and Fall 2010 groundwater monitoring events are shown in Table 4-2. The following observations are summarized:

- In the SATG area, the maximum TCE concentration decreased by one order of magnitude between the 2008 baseline groundwater monitoring and the Fall of 2010 annual groundwater monitoring event.
- In the SATG area, DCE concentrations generally increased between the 2008 baseline groundwater monitoring and the Fall of 2010 annual groundwater monitoring event.
- In the SATG area, VC concentrations generally increased two orders of magnitude in some wells (MW-70-27, MW-70-MNA01) and even three orders of magnitude in MW-70-PMW01B.
- Since the SATG injections of EVO were completed in August 2010, the decrease in TCE and increase in DCE and VC may be attributed to the completion of the ESTCP project in late 2009.
- The micromolar concentrations presented in Section 3 for each of the biobarriers support the CSM and demonstrate that dechlorination is occurring in the Upper Fines.
- TCE, DCE and VC were not reported above the reporting limit in the Upper Fines POC wells.

The results for other COCs present in the Upper Fines may be summarized as follows:

- Chloroform was reported below the TCG of 100 µg/L in the Upper Fines, SATG and POC wells during the Fall of 2010 annual groundwater monitoring event, consistent with the 2008 baseline and 2009 annual groundwater monitoring events.
- 1,1-DCE was reported above the TCG of 6 µg/L in the Upper Fines and SATG wells, during the Fall 2010 annual groundwater monitoring event. 1,1-DCE was reported below detection limits in the Upper Fines POC wells.
- Tetrachloroethene (PCE) was reported at low concentrations, below the MCL of 5 µg/L in all of the SATG and four Upper Fines POC wells during the Fall 2010 annual groundwater monitoring event.

1,2-DCA was reported above the State MCL of 0.5 µg/L in several of the SATG wells – however, the selected EISB remedy will also address this contaminant. Concentrations of 1,2-DCA will continue to be monitored to ensure compliance with the MCL.

Although not a COC, MTBE was reported at a concentration of 2.8 µg/L in Upper Fines POC well MW-70-02 during the Fall 2010 annual groundwater monitoring event. MTBE was reported at a concentration of 2.4 µg/L during the 2009 groundwater monitoring event. Since MW-70-02 is upgradient of the Source Area, MTBE may have a source north of IR Site 70, most likely outside Navy property. In review of the State Water Resources Control Board GeoTracker web site, 3 gas stations are located directly upgradient and off-site of IR Site 70 and may be potential sources of the MTBE (SWRCB, 2011).

The following other constituents, not considered COCs at Site 70, were also reported in the Upper Fines unit during the Fall 2010 groundwater monitoring event and are below MCLs: 1,1,1-trichloroethane (1,1,1-TCA), 1,1,2-trichloroethane (1,1,2-TCA), 1,1-dichloroethane (1,1-DCA), 1,2-dichloropropane, 2-butanone, 2-hexanone, acetone, benzene, carbon disulfide, chloroethane, chloromethane, ethylbenzene, Freon 113, methylene chloride, o-xylene, toluene, trichlorofluoromethane, total xylenes (Tables 3-2 and 3-3).

4.3.2 FIRST SAND CONTAMINANTS OF CONCERN

Groundwater samples were collected from thirty-two First Sand wells, and 4 First Sand POC wells during the Fall 2010 annual groundwater monitoring event (Tables 3-4 through 3-7). Concentration contours showing TCE, cis-1,2-DCE and VC in the Upper Fines in the Fall 2010 groundwater monitoring event at the Target Cleanup Goals are depicted in Figures 4-9 through 4-11.

A comparison of the concentrations of TCE, 1,2-DCE (cis- and trans-) and VC reported in the First Sand performance monitoring wells during the 2008 baseline and Fall 2010 groundwater monitoring events are shown in Table 4-2. The following observations are summarized:

- Although the maximum 2010 TCE and cis-1,2-DCE concentrations in the First Sand were of similar magnitude and concentration to the 2008 baseline event, the location of the maximum TCE and cis-1,2-DCE concentrations shows that the greatest concentration decrease occurred in the area of the SAB, which was the first biobarrier where EISB was implemented at IR Site 70. Hence, the area around the SAB has had the greatest change in transformation from TCE to cis-1,2-DCE where EISB has had a longer time to be effective.
- In addition, in the area associated with FSB-2, where EISB implementation was completed in November 2009, monitoring wells MW-70-MNA10 and MW-70-MNA12 have shown a two-order magnitude decrease in TCE concentrations and an order of magnitude increase in cis-1,2-DCE concentrations. This is evidence that dechlorination is progressing in FSB-2.
- TCE concentrations decreased two orders of magnitude in well MW-70-MNA08, downgradient of FSB-1. Cis-1,2-DCE concentrations increased an order of magnitude in well MW-70-MNA08, located downgradient of FSB-1.
- TCE concentrations decreased an order of a magnitude in well MW-70-MNA07, directly downgradient of FSB-1.

- Cis-1,2-DCE was reported below the TCG of 6 µg/L in First Sand POC wells MW-70-11 and MW-70-35 during the Fall 2010 groundwater monitoring event. Cis-1,2-DCE was reported at approximately the same concentrations (below 2 µg/L) in these wells during the 2008 baseline event.

The results for the remaining COCs in the First Sand may be summarized as follows:

- Chloroform was reported below the TCG of 100 µg/L in the First Sand POC wells during the Fall of 2010 annual groundwater monitoring event, consistent with the 2008 baseline and 2009 annual groundwater monitoring events.
- 1,1-DCE was reported above the TCG of 6 µg/L in the First Sand well MW-70-PMW04B, MW-70-MNA08, MW-70-PMW06A and MW-70-PMW06B during the Fall of 2010 annual groundwater monitoring event. 1,1-DCE was reported below detection limits in the Upper Fines POC wells.
- PCE was reported below reporting limits in the First Sand during the Fall 2010 annual groundwater monitoring event.

1,1-DCA was reported below MCLs in First Sand POC well MW-70-35, consistent with data reported during the 2008 baseline event.

The following other constituents were also reported in the First Sand unit during the Fall 2010 groundwater monitoring event and are below MCLs: 1,1-DCA, 1,2-dichloropropane, 2-butanone, 4-methyl-2-pentanone, 2-hexanone, acetone, benzene, carbon disulfide, chloroethane, chloromethane, ethylbenzene, m,p-xylene, o-xylene, toluene, trichlorofluoromethane, total xylenes (Tables 3-4 through 3-7).

4.3.3 SHELL HORIZON CONTAMINANTS OF CONCERN

Groundwater samples were collected from thirteen Shell Horizon wells, and one Shell Horizon POC well during the Fall 2010 annual groundwater monitoring event (Tables 3-8 through 3-10). Concentration contours showing TCE, cis-1,2-DCE and VC in the Upper Fines in the Fall 2010 groundwater monitoring event at the Target Cleanup Goals are depicted in Figures 4-12 through 4-14.

A comparison of the maximum concentrations of TCE, 1,2-DCE (cis- and trans-) and VC reported in the Shell Horizon during the 2008 baseline and Fall 2010 groundwater monitoring events are summarized in Table 4-2. The following observations are summarized:

- TCE concentrations have decreased two orders of magnitude in injection well IW-70-SHB113, associated with SHB-1, and almost an order of magnitude in well MW-70-PMW10, downgradient of SHB-1 between the 2008 baseline and Fall 2010 annual groundwater monitoring events. Similarly, TCE concentrations have reduced two orders of magnitude in wells associated with SHB-3 between 2008 and 2010. SHB-1 and SHB-3 EISB implementations were completed on April 2010 and September 2009, respectively. TCE reduction of almost an order of magnitude is also observed in well IW-70-SHB217, located between SHB-1 and SHB-3.

- Cis-1,2-DCE concentrations have generally increased in wells associated with both SHB-1 and SHB-3, although in some wells, the transformation to VC appears to have occurred (e.g., IW-70-SHB113, MW-70-PMW12B).

The results for the remaining COCs in the Shell Horizon may be summarized as follows:

- Chloroform was reported below reporting limits in the Shell Horizon wells during the Fall of 2010 annual groundwater monitoring event, consistent with the 2008 baseline and 2009 annual groundwater monitoring events.
- 1,1-DCE was reported above the TCG of 6 µg/L in the Shell Horizon well MW-70-PMW10 during the Fall 2010 annual groundwater monitoring event. This is consistent with previous monitoring event, which was conducted in summer 2010.
- PCE was reported below reporting limits in the Shell Horizon during the Fall 2010 annual groundwater monitoring event.

VOCs were reported below reporting limits in Shell Horizon POC well MW-70-23.

The following other constituents were also reported in the Shell Horizon during the Fall 2010 groundwater monitoring event and are below MCLs: 1,1-DCA, 2-butanone, acetone, carbon disulfide, chloroethane, toluene (Tables 3-8 through 3-10).

4.3.4 SECOND SAND CONTAMINANTS OF CONCERN

Groundwater samples were collected from eleven Second Sand wells, and five Second Sand POC wells during the Fall 2010 annual groundwater monitoring event (Tables 3-11 through 3-12). Concentration contours showing TCE, cis-1,2-DCE and VC in the Second Sand in the Fall 2010 groundwater monitoring event at the Target Cleanup Goals are depicted in Figures 4-15 through 4-17.

A comparison of the maximum concentrations of TCE, 1,2-DCE (cis- and trans-) and VC reported in the Second Sand during the 2008 baseline and Fall 2010 groundwater monitoring events are shown in Table 4-2. The following observations are summarized:

- TCE concentrations in groundwater within and immediately adjacent to the SSB-1 have generally remained stable or decreased, between the 2008 baseline and Fall 2010 annual monitoring events, However, since the EISB implementation in March 2009, TCE concentrations in the Second Sand, upgradient and downgradient of SSB-1, have increased in wells MW-70-MNA15, MW-70-43B, and MW-70-15. TCE concentrations in well MW-70-14, located approximately 600 feet north/northeast of SSB-1, have remained stable between the January 2010 and Fall 2010 sampling events, but have increased since the pre-remediation sample taken in 2005 (45 µg/L; BEI 2006). Well MW-70-14 was added to the annual performance monitoring wells in 2009.
- Cis-1,2-DCE concentrations follow a similar trend of stable or decreasing concentrations within and adjacent to the SSB-1 between the 2008 baseline and the Fall 2010 annual monitoring events. However, outside of SSB-1, cis-1,2-DCE concentrations have

increased (e.g., MW-70-MNA15, MW-70-14, MW-70-15, and MW-70-43B). Cis-1,2-DCE was reported below TCGs of 6 µg/L in Second Sand POC well MW-70-36.

- VC remained stable or decreasing in the upgradient MW-70-PMW13A and MW-70-PMW-13B and within the SSB-1. VC has increased two orders of magnitude in performance monitoring wells directly downgradient of SSB-1: MW-70-PMW14A and MW-70-PMW14B.

In addition, the lateral northeastern edge of the Second Sand dissolved plume is defined by the concentrations in well MW-70-14, approximately 600 feet north of the SSB-1. It appears that this area of the plume may not be influenced by the active EISB. The Navy will be monitoring this area closely along with data from well MW-70-43B to ensure that the design criteria for the bioremediation are met.

The results of the remaining COCs in the Second Sand may be summarized as follows:

- Chloroform was reported below reporting limits in the Second Sand wells during the Fall of 2010 annual groundwater monitoring event, consistent with the 2008 baseline annual groundwater monitoring events.
- 1,1-DCE was reported below the TCG of 6 µg/L in the Second Sand wells during the Fall 2010 annual groundwater monitoring event.
- PCE was reported below the MCL of 5 µg/L in the Second Sand POC well MW-70-36 during the Fall 2010 annual groundwater monitoring event, consistent with the 2008 baseline event. In the Fall 2009 sampling event, PCE was reported above the MCL at a concentration of 30 µg/L, but a duplicate sample collected in Fall 2010, confirms that concentrations are stable at 2.7 (original) and 3.0 (duplicate) µg/L since 2008.

The following other constituents were also reported in the Second Sand during the Fall 2010 groundwater monitoring event and are below MCLs: 1,1-DCA, 2-butanone, 2-hexanone, 4-methyl-2-pentanone, acetone, carbon disulfide, chloroethane, ethylbenzene, and xylenes (Tables 3-11 and 3-12).

4.3.5 DEEP SAND CONTAMINANTS OF CONCERN

All COCs were reported below TCGs in the three Deep Sand POC wells during the Fall of 2010 annual groundwater sampling. VC was reported at an estimated concentration of 0.20 µg/L in Deep Sand POC well MW-70-POC02 (Figure 4-18).

4.3.6 VISUALIZATION AND SUMMARY OF DISSOLVED PLUME EXTENT

The groundwater data from the Fall 2010 performance monitoring event were imported into an updated post-EISB three-dimensional (3-D) visualization software (EarthVision) as a separate, stand alone data set. By having the 2008 and 2010 data sets generate separate models, the extent of the current TCE plume to the baseline plume is compared to provide a better understanding of progress achieved at IR Site 70 to date. A discussion on the spatial extent of the chlorinated ethenes is provided in the subsequent subsection based on the following EarthVision figures and two-dimensional (2-D) plume contours:

- **2-D CONTOURS OF TCE** - The plume extent for TCE greater than 1000 µg/L in the Source Area at 35 feet bgs is depicted in Figure 4-22. Two cross-sectional views of TCE concentrations greater than 250 µg/L in the source area are shown in Figures 4-23 and 4-24. In addition, the 2008 and 2010 2-D TCE plume extent is projected to the surface to show the change in TCE plume morphology through the units in Figures 4-19 and 4-20, respectively.
- **3-D PLUME MORPHOLOGY** – As part of the visualization of the dissolved plume morphology, 3-D figures were generated using EarthVision for TCE, cis-1,2-DCE and VC (Figures 4-25, 4-26 and 4-27). The 3-D plume figures are shown at TCE concentrations greater than 250 µg/L (Figure 4-25), the design basis concentration for which the active bioremediation was designed (Geosyntec 2006b). The reductive dechlorination daughter products, cis-1,2-DCE and VC, are depicted at concentrations greater than 10 times the TCGs: Figure 4-26 at 60 µg/L for cis-1,2-DCE and Figure 4-27 at 50 µg/L for VC. These figures present the chlorinated ethene (i.e., TCE, cis-1,2-DCE, and VC) plume morphologies in four view points: plan, oblique, profile, and rotated 32° from horizontal.
- **SELECTED CROSS-SECTIONS -** To provide an understanding through the center line of the plume, longitudinal cross-section (J-J') figures were generated for TCE, cis-1,2-DCE and VC (Figure 4-28, 4-29, and 4-30, respectively).

4.3.6.1 TRICHLOROETHENE

Overall changes noted during the post-EISB performance monitoring include a reduction in the number of wells where concentrations of TCE greater than 250 parts per billion (ppb) were observed. Specifically, a total of 11 out of 58 performance monitoring wells in 2010 had TCE concentrations greater than 250 µg/L compared to 32 out of 56 wells during the baseline in 2008. In comparison to the baseline CSM, the updated greater than 250 µg/L TCE plume distribution shows substantial decreases in width (orthogonal to the plume axis [cross-section line J-J'] in plain view), length (parallel to the plume axis [J-J'] in plain view) and depth (vertical distribution along J-J'). These comparisons are based on the numerical model calculated using the 2010 monitoring results.

The extent of the 250 µg/L plume in the Second Sand is generally wider than originally anticipated per the Remedial Design (Geosyntec 2006b). The addition of well MW-70-14 to the Second Sand monitoring program in 2009, allowed characterization of the northeastern portion of the dissolved plume.

The extent of the 5 µg/L (MCL) TCE plume appears stable, but is extended slightly downgradient in the Second Sand. In this area, TCE concentrations in MW-70-15 measured in 2010, are reported at 14 µg/L, which is an increase from the 2009 concentration of 6.9 µg/L, and an estimated concentration of 1.6 µg/L in 2008 baseline results. All compliance wells were non-detect for TCE during the recent performance monitoring event, thus the updated CSM indicates that the plume is completely contained within the point of compliance well boundary.

4.3.6.2 CIS-1,2-DICHLOROETHENE

The greater than 60 µg/L cis-1,2-DCE plume of the updated post-EISB CSM, as shown in Figure 4-26, is distributed across the site and generally mimics the distribution of the greater than 250 µg/L TCE plume represented in the baseline CSM (Appendix G). The highest concentrations have been observed at the source zone of the plume (i.e., near the SATG) with a generally decreasing concentration trend towards the toe of the plume (i.e., downgradient of SSB-1).

During the post-EISB performance monitoring a total of 29 out of 58 performance monitoring wells had cis-1,2-DCE concentrations greater than 60 µg/L, compared to 28 out of 56 wells during the baseline. Of the compliance wells sampled during the post-EISB performance monitoring event, 9 out of 11 point of compliance wells were non-detect for cis-1,2-DCE and the other two had concentrations of 1.4 and 1.6 µg/L, which are below the MCL of 6 µg/L. The compliance well results indicate that the cis-1,2-DCE plume is completely contained within the point of compliance well boundary.

4.3.6.3 VINYL CHLORIDE

The greater than 50 µg/L VC plume of the updated post-EISB CSM, as shown in Figure 4-27, is limited to five discrete regions of the site, similar to the distribution of TCE concentrations greater than 250 µg/L, including:

- the SATG zone, bound within the upper-fines lithologic unit;
- upgradient of the FSB-1, within the First Sand lithologic unit;
- downgradient of the FSB-2, within the First Sand lithologic unit;
- straddling the SHB-3, within the Shell Horizon lithologic unit; and
- straddling the SSB-1, within the Second Sand lithologic unit.

The highest concentrations have been observed at source zone of the plume (i.e., near the SATG) with a generally decreasing concentration trend towards the toe of the plume (i.e., downgradient of SSB-1).

During the post-EISB performance monitoring, a total of 17 out of 58 performance monitoring wells had VC concentrations greater than 50 µg/L, compared to 1 out of 56 wells during the baseline. VC was not specifically modeled during the development of the baseline CSM so comparisons of the post-EISB CSM could not be performed; however maximum detected concentrations of VC throughout the TCE plume were evaluated. All compliance wells were non-detect for VC during the recent performance monitoring event, thus the updated CSM indicates that the plume is completely contained within the point of compliance well boundary.

4.4 SOIL VAPOR RESULTS

Twelve soil vapor probes were installed at the locations shown in Figure 1-3 as part of the baseline monitoring performed in 2008, in order to monitor methane and hydrogen sulfide gases

within the vadose zone soils (Insight 2009a). The twelve soil vapor probes are constructed within the vadose zone at depths between 5 and 6 ft bgs. These locations were chosen to correspond with areas present near active buildings or underground utility corridors containing potentially high concentrations of electron donor. The probes were installed around the source area and downgradient to monitor for migration of these gases as required by the RAWP (ECC/Geosyntec 2008a). Monitoring of these gases over the course of the remedial action at IR Site 70 is important for the protection of onsite workers, including those engaged in the remedial action as well as the many tenants/occupants of the surrounding facilities.

During the 2010 performance monitoring, soil gas samples were collected from the 11 soil vapor probes, and were analyzed for methane and hydrogen sulfide gases. Originally, 12 soil vapor probes were installed for sampling. However, soil vapor probe SV-70-03 was not sampled due to presence of water in the sample tubing. The analytical results are shown in Table 4-3 and Figure 4-21 and discussed in further detail below.

4.4.1 METHANE SOIL VAPOR RESULTS

Methane was reported in all samples and ranged from 230 parts per million by volume (ppmV) at SV-70-01 (north of Building 118) to 640,000 ppmV at SV-70-05 (southwest of Building 118). The lower explosive limit (LEL) for methane in air is 5 percent (or 50,000 ppmv) while the upper explosive limit (UEL) in air is 15 percent (or 150,000 ppmv). Methane was reported in two samples (SV-70-05, and SV-70-10) at concentrations above the UEL and in one sample (SV-70-09) at a concentration between the UEL and the LEL. The concentration of methane reported in one other sample (SV-70-02) was slightly above the LEL. In general, compared to the 2009 soil vapor sampling event, the methane concentrations have increased in five soil vapor probes (SV-70-07, SV-70-08, SV-70-10, SV-70-11, and SV-70-12) and decreased in six soil vapor probes (SV-70-01, SV-70-02, SV-70-04, SV-70-05, SV-70-06, and SV-70-09) during the 2010 soil vapor sampling event. The highest concentration of methane reported during the 2010 sampling event (SV-70-05) was measured in sample collected from location immediately adjacent to the passive test cell used as part of the ESTCP project (CDM 2007) and SATG injection wells. The greatest concentration measured in the vicinity of the SAB wells was 380,000 ppmV.

4.4.2 HYDROGEN SULFIDE SOIL VAPOR RESULTS

Hydrogen sulfide was reported only in one sample collected from soil vapor probe location SV-70-05 (southwest of Building 118) at a concentration of 1.3 ppmV and was not detected above the laboratory reporting limit of 1.0 ppmV in the other ten soil vapor samples (SV-70-01, SV-70-02, SV-70-04, and SV-70-06 through SV-70-12) collected during the 2010 sampling event. The concentration of hydrogen sulfide reported in soil vapor probe location SV-70-05 is well below the LEL of 4 percent (or 40,000 ppmv) and the and the Occupational Safety and Health Administration (OSHA) health based time-weighted average (TWA) permissible exposure limit of 10 ppmv.

4.4.3 AMBIENT AIR MONITORING FOR METHANE GAS

A methane monitoring plan was prepared (Insight 2009c) to monitor and document methane levels within utility corridors and buildings where methane concentrations could accumulate in air above the LEL. As part of this plan, selected locations throughout the RT&E Area were monitored weekly for the first two months of the EISB activities, and monthly thereafter. Monitoring locations were selected based on analytical results from soil gas probes installed within the vadose zone soils and the proximity of the probes to nearby utility corridors, buildings, and groundwater wells. The following locations were monitored periodically for methane gas in the RT&E area:

- Inside Buildings 118, 121, 123 (northwest corner), and 124.
- In the vicinity of utility corridors west of the tank farm and east of soil gas probes SV-70-02 and SV-70-05.

A hand-held multi-gas meter (RKI Eagle), equipped with methane and oxygen sensors, was used to monitor for the presence of explosive vapors and oxygen levels within the selected areas. Inside buildings, readings were taken within the breathing zone and at or near surface features (e.g., cracks, joints, penetrations, subsurface utility accesses) in the floor slab that could serve as potential pathways for the infiltration of methane gas from the underlying soils or through connecting subsurface utility chases. Stagnant areas where methane gas could potentially accumulate were also monitored. Readings were recorded on a map of the building. In outdoor areas, readings were taken in and around access openings to utility corridors and groundwater well boxes, and at or near cracks in the asphalt and/or other surface features that could serve as migration pathways for methane gas. Readings were recorded on an area map.

Logs that documented the monitoring results were prepared and submitted to the Remedial Project Manager, Station IR Program Manager, and Facilities Engineering Acquisition Division, Seal Beach upon completion of each monitoring event. Methane gas was not detected in the ambient air within the breathing zone either inside the buildings or in outdoor areas of the locations monitored to date in the RT&E area.

4.4.4 MEASURES TAKEN TO PROTECT ONSITE WORKERS

The following precautionary measures were instituted to protect onsite workers from the effects of methane gas production during remedial action at IR Site 70.

- Instituted a methane monitoring program to monitor and document methane levels within utility corridors and buildings where methane concentrations could accumulate in air above the LEL.
- Notified building tenants/occupants of the potential methane intrusion.
- Posted warning signs throughout the area and on entrances to utility corridors to warn of the potential presence of flammable vapors.

- Posted no smoking and no parking signs in areas that could potentially present an explosive hazard.
- Designated specific smoking areas that are well outside areas of potential explosive hazard.

4.4.5 SUMMARY OF SOIL VAPOR RESULTS

The highest concentration of methane reported in the soil gas sample SV-70-05 is located adjacent to the ESTCP project study area and SATG injection wells (in which the target EVO volumes were injected between May 26 and August 3, 2010 prior to sampling of soil vapor probes on September 10, 2010). The ESTCP project utilized an electron donor (sodium lactate), which similar to EVO, can stimulate the production of methane. Concentrations measured in the vicinity of the SAB wells ranged from 1,100 ppmV to 380,000 ppmV, which are also an indication that methanogenesis is occurring in the SAB.

Continued production of methane during EISB and subsequent mixing with air can produce concentrations within the explosive range. Migration from the vadose zone soils to the surface through cracks in the asphalt and/or to nearby utility corridors through preferential pathways in the subsurface is a potential hazard. However, a methane monitoring plan has been put in place to ensure that onsite workers are protected.

4.5 CONCLUSIONS

Based on the above discussion, the following conclusions can be drawn from the 2010 updated CSM.

- **Groundwater Level:** Water level elevations have increased approximately 6 feet in all hydrostratigraphic zones since 2009, which may be attributable to an increase in rainfall in WY2010. However, hydraulic gradients and direction of groundwater flow remain consistent compared to previous years.
- **TCE:** The greater than 250 µg/L TCE plume from the updated post-EISB CSM shows marked decreased in the width, length and vertical distribution of TCE compared to the baseline CSM. The extent of the 5 µg/L (MCL) TCE plume appears stable, but is extended slightly downgradient in the Second Sand where TCE concentrations in MW-70-15 in 2010 are reported at 14 µg/L, an increase from the 2009 concentration of 6.9 µg/L, and an estimated concentration of 1.6 µg/L in 2008 baseline results. However, the updated CSM indicates that the plume is completely contained within the point of compliance well boundary. In addition, TCE concentrations in the southeastern extent, at the toe of the Second Sand plume and downgradient of SSB-1, have increased and will need to be closely monitored to ensure that EISB is being effective in dechlorination in this area.
- **cis-1,2-DCE:** The greater than 60 µg/L cis-1,2-DCE plume from the updated post-EISB CSM mimics the morphology of the greater than 250 µg/L TCE plume from the baseline CSM. Increases in cis-1,2-DCE across the site, specifically within the historic (i.e., baseline) greater than 250 µg/L TCE plume, indicate reductive dechlorination of TCE is

occurring at the site. Additionally, the updated CSM indicates that the plume is completely contained within the point of compliance well boundary.

- **VC:** The greater than 50 µg/L VC plume from the updated post-EISB CSM has a similar distribution to that of the TCE greater than 250 µg/L plume. Increases in VC across the site, specifically within the historic (i.e., baseline) greater than 250 µg/L TCE plume, indicate reductive dechlorination of higher order chlorinated ethenes (i.e., TCE and cis-1,2-DCE) is occurring at the site. Additionally, the updated CSM indicates that the plume is completely contained within the point of compliance well boundary.
- **Soil Vapor:** Soil vapor monitoring indicates methanogenesis is occurring in the SATG and SAB areas and requires continued monitoring.

The lateral extent of the dissolved COC plume in the Second Sand is wider in the area northeast of the plume (Figures 4-15 through 4-17) than originally anticipated in the Remedial Design (Geosyntec 2006b) due to the groundwater monitoring information obtained in 2009 and 2010 from well MW-70-14. The Navy will be monitoring this area closely along with well MW-70-43B. Hence, a second sand monitoring well downgradient of MW-70-14 and northeast of the current SSB-1 is proposed (Figure 4-20).

Table 4-1 (continued)

Well Number	Screen Interval (feet bgs)[a]	TOC Elevation (feet above MSL)	8/18/08			8/24/09			8/25/10		
			Time	Depth to Groundwater (feet below TOC)	Groundwater Elevation (feet +/- MSL)	Time	Depth to Groundwater (feet below TOC)	Groundwater Elevation (feet +/- MSL)	Time	Depth to Groundwater (feet below TOC)	Groundwater Elevation (feet +/- MSL)

Notes:

* existing monitoring well added in 2009 for sampling

** Depth to groundwater was remeasured on 9/14/2009 to check the accuracy of the previously reported depth

[a] - screen intervals is rounded to the nearest foot

[b] - groundwater levels for wells MW-70-27 and MW-70-28 were measured on 8/21/08, since the wells were not accessible during the 8/18/08 measurement events

Acronyms/Abbreviations:

bgs - below ground surface

MSL - mean sea level

NA - not available

TOC - top of casing

Section 5

VARIANCES TO THE WORK PLAN AND THE DATA QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

This section summarizes the variances to the RAWP and the Data Quality Assurance/Quality Control results for the period between November 2009 and December 2010.

5.1 VARIANCES TO THE WORK PLAN

The primary variance to the RAWP, during this period were 1) Changes to the performance monitoring schedule, and 2) Modifications to the injection mixtures, which were based on lessons learned in the 2009 EISB implementation.

5.1.1 CHANGES TO THE PERFORMANCE MONITORING SCHEDULE

The RAWP tentative sampling schedule (Table 6.2 of RAWP, ECC/Geosyntec 2008a) indicates quarterly sampling for year one, followed by semi-annual and annual sampling. Per the monitoring schedule presented in the RAWP, quarterly sampling consisted of monitoring 11 wells (4 SATG, 1 SAB, 2 FSB-1, 1 FSB-2, 1 SHB-1, 1 SHB-3, and 1 SSB-1).

The 2010 performance monitoring schedule is presented in Table 1-1 and consisted of the following frequency of wells:

1. Monthly field and on-site geochemistry (after the installation of the biobarriers) in 26 wells: SAB (3 wells), FSB-1 (6 wells); FSB-2 (6 wells); SHB-1 (3 wells); SHB-3 (4 wells); SSB-1 (4 wells). Field and on-site geochemistry monitoring consisted of: depth to water, pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, turbidity, alkalinity, sulfide, sulfate, iron (total) and nitrate This monthly monitoring was effective in assessment of the performance and geochemistry of the biobarriers to ensure that anaerobic conditions were being sustained and groundwater geochemistry conditions were present for effective bioremediation to occur and that no negative effects on secondary groundwater geochemistry were occurring (Tables 2-5 through 2-11).
2. Quarterly field parameters, on-site geochemistry, and off-site laboratory analytical sampling was conducted in 15 wells: FSB-1 (6 wells); FSB-2 (6 wells); SHB-1(3 wells). Field parameters and on-site geochemistry consisted of analytes listed in the monthly sampling. Off-site laboratory analyses consisted of: VOCs, DHGs, VFAs, TOC and Dhc/vcrA (Tables 3-2 through 3-27).
3. Semi-annual field parameters, on-site geochemistry, and off-site laboratory analytical sampling was conducted in 12 wells: SAB-1 (4 wells); SHB-3 (4 wells); SSB-1 (4 wells). Field parameters and on-site geochemistry consisted of analytes listed in the monthly sampling. Off-site laboratory analyses consisted of: VOCs, DHGs, VFAs, TOCs and Dhc/vcrA (Tables 3-2 through 3-27).
4. Annual field parameters, on-site geochemistry, and off-site laboratory analytical sampling was conducted in 72 monitoring wells and 14 POC wells: SATG (16 wells); SAB (8 wells); FSB-1 (15 wells); FSB-2 (9 wells); SHB-1 (5 wells); SHB-3 (8 wells); SSB-1 (11 wells); POC wells (14 wells). Field parameters and on-site geochemistry

consisted of analytes listed in the monthly sampling. Off-site laboratory analyses consisted of: VOCs, DHGs, VFAs, TOCs and Dhc/vcrA (Tables 3-2 through 3-27).

The frequency and sampling of the wells was determined to adequately address the remedial action objectives at IR Site 70. However, the frequency of the groundwater monitoring at IR Site 70 was affected by the continuing resolution of the federal government in early 2011. The Navy will conduct a quarterly monitoring event between the next 2 sampling events: July 2011 and October 2011 (Table 6-1). The data acquired during this quarterly frequency will be evaluated to determine the next frequency of groundwater monitoring at IR Site 70.

5.1.2 INJECTION VARIANCES

The following injection variances are noted based on lessons learned during the 2009 EISB implementation at IR Site 70.

Addition of Sodium Bicarbonate to Chase Water. Sodium bicarbonate was added to the chase water used for the KB-1® injections in the SATG, FSB-1, FSB-2, and SHB-1 biobarriers. This modification was made based on lessons learned during the 2009 EISB implementation, which indicated that sodium bicarbonate would mitigate a decrease in pH during injections. The sodium bicarbonate was effective in adding buffering capacity to the aquifer.

Modification of EVO formula. In order to mitigate a reduction of pH in the aquifer, the 4% lactate that was specified in the RD, was removed from the EVO mixture prior to injection into the FSB-1, FSB-2 and SHB-1 biobarriers. The lactate was retained for the SATG since the alkalinity in the Source Area during the baseline monitoring was greater than 300 mg/L, which was higher than alkalinity concentrations in the other hydrostratigraphic zones. In addition, since the RD pilot test had successfully been tested in the Source Area with the 4% lactate EVO mixture, a variation in the Source Area was not required.

Modification to the Injection Sequence in the FSB-1. As part of the field implementation of the EISB in the FSB-1, and described in Section 2, one of the original injection wells, RDO-4, was not available for injection because the casing was compromised and filled with sand. This well is located between injection well IW-70-FSB-114 and IW-70-FSB115. To compensate for not being able to inject the amendments into this well, the volume of EVO and KB-1® that would have been injected into this well were injected into well FSB114. During injection into FSB114, groundwater was extracted from well FSB115 to try to distribute and recirculate EVO and KB-1® between the two wells in the area in which the RDO-4 was installed.

5.2 QUALITY ASSURANCE/QUALITY CONTROL SUMMARY

This section summarizes quality assurance and quality control findings of the analytical results sampled during this performance period. Groundwater from 86 monitoring wells (74 monitoring wells and 12 injections wells), selected for periodic performance and annual groundwater monitoring were sampled and analyzed in accordance with the Final SAP and SAP Addendum (ECC/Geosyntec 2008a; Insight 2009b). All groundwater samples were analyzed by EMAX Laboratories located in Torrance, California, except for deoxyribonucleic acid (DNA) assay analysis which was analyzed by SiREM located in Ontario, Canada. Appendix C summarizes

laboratory analyses performed on groundwater samples collected from each well at IR Site 70 in August through September 2010, and Tables 3-2 through 3-27 present all groundwater results. The results of the groundwater 2010 performance monitoring are summarized in Section 3. Appendix D details data usability assessment and data validation reports. Table 5-1 summarizes the results of the assessment for the data quality indicators of accuracy, precision, completeness, comparability and representativeness.

Procedures from the following methods were used to analyze groundwater and field quality control samples:

- VOCs were analyzed using United States Environmental Protection Agency (U.S. EPA) Method 8260B With the exception of IW-70-SHB113 in 2008 (Table 3-8) and IW-70-SHB310 in 2009 (Table 3-9), no other reporting limits for VOCs where changed;
- DHGs consist of ethane, ethene, and methane and were analyzed using RSK 175;
- Anions (bromide, chloride, sulfate, nitrate, nitrite) were analyzed using U.S. EPA Method 300.0;
- VFAs (acetate, butyrate, lactate, propionate) were analyzed using U.S. EPA Method 300.0M;
- TOC was analyzed using Standard Method 5310B;
- Dissolved Hydrogen Sulfide was analyzed using Standard Method 4500F;
- TDS was analyzed using Standard Method 2540C;
- Dissolved Metals (arsenic, iron, manganese) were analyzed using U.S. EPA Method 6010B; and
- DNA assay analysis was analyzed using SiREM developed Quantitative Gene-Trac Test.

Soil gas vapor samples were collected for analysis of methane and hydrogen sulfide at 12 locations presented in Figure 1-3 using U.S. EPA Methods 25C and 16, respectively. Methane vapor samples were analyzed by Calscience Environmental located in Garden Grove, California. If methane was not detected using Method 25C, then the sample was reanalyzed using Method 3C. The purpose of the soil vapor probes and sampling was to monitor migration of methane and hydrogen sulfide in the vadose zone in the source area and downgradient of the source area.

The laboratory's quality assurance oversight involved the performance of a first-level screening of the data and an indication of any deviations from their precision, accuracy, detection limit, or laboratory QA/QC criteria. A copy of the laboratory QA/QC analytical results can be found in Appendix C. A representative from the laboratory signed the data sheets, ensuring that the screening described above had been completed. Subsequently, Insight completed data review by comparing chain-of-custody forms, sample receipts, sample log-ins, and laboratory data packages. Review of these summaries confirmed that data quality objectives were met.

Additionally, the analytical data, along with the associated laboratory quality control information, were forwarded to Laboratory Data Consultants, Inc., an independent data validation service, for data validation. A U.S. EPA Level III data validation was performed on 90 percent of the groundwater samples; the remaining 10 percent of the samples underwent a Level IV data validation. Copies of the chain-of-custody documentation are included in Appendix B.

Data validation includes evaluation of holding times, sample preservation, cooler temperatures, calibrations, blanks, laboratory quality control samples, and field quality control samples. Generally, the results were within analytical criteria with a few minor exceptions, such as calibration outliers of some VOC compounds, detection of carbon disulfide in the laboratory method blank, and low spike recovery during alkalinity testing. For the most part calibration outliers affected VOC compounds that are not constituents of concern of Site 70. All affected compounds were qualified “J” or “UJ”.

QA/QC measurements were taken in the field to ensure that meaningful and representative data sets were generated. Field duplicate samples were collected at a rate of 10 percent of the total number of groundwater monitoring wells sampled and one trip blank sample was included in each cooler that contained volatile organic analysis vials. These samples were collected to ensure the consistency and integrity of sample collection methods. Field duplicate samples were collected for wells IW-70-SAB11, IW-70-SAT16, MW-70-14, MW-70-36, MW-70-MNA06, MW-70-PMW01A, MW-70-PMW08B, MW-70-PMW10, MW-70-PMW12B, MW-70-PMW14B, and MW-70-POC02. Field duplicate results are generally similar to the original results and no significant problems were noted. Eleven trip blank samples were shipped. No VOC contaminant was reported in the trip blanks with the exception of methylene chloride (0.58J µg/L 9/15/10, 0.68J µg/L 8/30/10, 0.77J µg/L 9/20/10, 0.71 J µg/L 9/22/10, 0.66 J µg/L 9/23/10, 0.74 J µg/L 9/28/10, 0.65 J µg/L 9/10/10, 0.58 J µg/L 9/15/10, 0.82 J µg/L 9/27/10, 0.52 J µg/L 9/7/10, 0.60 J µg/L 9/8/10, and 0.70 J µg/L 9/9/10).

Data were generally found to be acceptable with respect to accuracy, precision, completeness, and comparability criteria (Table 5-1). All analytical data presented in Tables 3-2 through 3-27 are valid and usable. Validation findings were advisory and findings are detailed in Appendix D.

Section 5

TABLE

Table 5-1
Quality Assurance/Quality Control Summary

Data Quality Indicators	Measurement Performance Criteria	2010 Performance Monitoring
Accuracy	Percent recoveries for MS/MSD Criteria Varies by compound	All data was considered accurate. Two analytes were qualified due to MS/MSD. All samples met accuracy criteria except: 1) Ethane in MS for IW-70-SHB319 had a low MS/MSD recovery (MS 37%, MSD 38%; range is 60-140%), final result received a 'J' qualifier. 2) Trichloroethene in MW-70-MNA02 (MSD 163%; range is 60-140%), final result received a 'J' qualifier.
Precision	RPD between duplicate results ≤25 percent	Overall precision was good. No data was qualified or rejected. All samples met RPD goal except: 1) Trichloroethane in MW-70-PMW10 (26.22 percent) The high RPDs in methane and sulfate may be due to the higher concentrations reported in these samples as a result of EISB implementation.
Completeness	95 percent completeness	Completeness was 100 percent. No samples were rejected.
Comparability	Qualitative	Standard methods, units and reporting formats met comparability requirements per the QA/QC program.
Representativeness	DQO parameters and proper sampling techniques	DQO parameters and analytical parameters meet QA/QC program requirements.

Acronyms/Abbreviations:

DQO – data quality objectives
EISB – Enhanced *In-Situ* Bioremediation
MS/MSD – matrix spike/matrix spike duplicate
QA/QC – quality assurance, quality control
RPD – relative percent difference

Section 6

SUMMARY AND RECOMMENDATIONS

The EISB remediation activities at IR Site 70 are being conducted in accordance with the technical and functional requirements specified in the RAWP (ECC/Geosyntec 2008a). Field activities are being performed as established in the SOPs contained in Attachment B-2 of the SAP.

The 2010 PMR documents the following activities between November 2009 and December 2010:

- Twenty-three SATG injection wells were constructed in May 2010 to support the injection of the EISB amendments in the SATG, following completion of the ESTCP project in that area.
- EISB implementation in the SATG, FSB-1, FSB-2, and SHB-1.
- Groundwater elevations were measured in 74 groundwater monitoring wells. Results are used to update the site conceptual model, ensure that the installation of the biobarriers are not adversely impacting groundwater flow, and to confirm that the biobarriers are placed to intersect the dissolved phase plume.
- Groundwater samples were collected from 86 groundwater monitoring wells (74 monitoring and 12 injection), which included monthly and semi-annual periodic performance monitoring in addition to the annual monitoring event. The groundwater samples were analyzed for VOCs, DHGs, VFAs, anions, TDS, alkalinity, TOC, dissolved hydrogen sulfide, dissolved metals, and Dhc/*vcr*A (Table 1-1). The results are used to evaluate the performance of the remedy and update the conceptual design for the site.
- Field parameters (groundwater temperature, pH, DO, ORP, specific conductance, turbidity) and depth to water were measured as part of the performance monitoring for the EISB activities, per the schedule outlined in Table 1-1, to ensure that the remedy is performing according to design. The data also provide important lines of evidence for determining if and when further injection of amendments will be required.
- Twelve soil vapor probes were sampled and ambient air was monitored for methane and hydrogen sulfide. These chemicals are byproducts of EISB and indicate that bioremediation is occurring. These compounds can be hazardous at elevated concentrations and must be closely monitored.

6.1 SUMMARY

As of August 2010, EISB has been implemented successfully in all 7 biobarrier areas at IR Site 70 (SATG, SAB, FSB-1, FSB-2, SHB-1, SHB-3, and SSB-1) successfully introducing the

designed target volumes of EVO and KB-1® injections (Section 2). Multiple lines of evidence were monitored and evaluated as part of the 2010 PMR, per the schedule in Table 1-1, to assess the remedy performance in each of the biobarrier areas (Section 3) and to present an updated CSM for IR Site 70 (Section 4).

6.1.1 SUMMARY OF REMEDY PERFORMANCE

Multiple lines of evidence were evaluated and support that EISB is working effectively at the biobarrier areas at IR Site 70. The different geochemical parameters that were monitored are summarized as follows:

- DO and ORP values measured during and after injection activities in the biobarriers and in downgradient performance monitoring wells indicate anaerobic and strongly reducing conditions. These conditions are expected to continue to provide the prerequisite conditions to promote degradation of the chlorinated ethenes at the site.
- Although a significant drop in pH was observed during injection of the amendments, in most areas, the pH is gradually returning to baseline conditions. Low pH (i.e. <5.5) could adversely impact the ability of the Dhc bacteria to dechlorinate the chlorinated ethenes.
- A significant reduction of total moles of all COCs is observed in all the biobarriers, which provides one line of evidence that conversion of TCE to DCE to VC to ethene and ethane is occurring.
- TOC concentrations were high in the biobarrier wells soon after injection activities and TOC concentrations have generally increased above 100 mg/L in most biobarriers. However, TOC concentrations have decreased in biobarriers SAB and SSB-1, which were installed during the first half of 2009.
- VFAs increased in all the biobarriers soon after injection. During subsequent monitoring events, concentrations of VFAs decreased suggesting that they are being consumed by the microbes in the biobarriers.
- Increased concentrations of DHGs, particularly methane and ethene, were evident in all of the biobarriers and is supporting evidence that methanogenesis is occurring as a result of the EISB.
- Moderate to optimum concentrations (10^7 cells/Liter) of Dhc and *vcr*A were measured in all the biobarriers, indicating microbial activity is present for further biodegradation. The concentration of Dhc remains in the moderate to optimal range in several of the downgradient performance monitoring wells such as MW-70-PMW03A (SAB), MW-70-PMW05A and MW-70-PMW05B (FSB-1), MW-70-PMW08A and MW-70-PMW08B (FSB-2), MW-70-PMW12A and MW-70-PMW12B (SHB-3), and MW-70-PMW14A and MW-70-PMW14B (SSB-1). However, in SHB-1, where EISB was completed in April 2010, Dhc was not yet reported in the downgradient performance monitoring well MW-70-PMW10 during the Fall of 2010 sampling. The lack of Dhc reported in MW-70-

PMW10 is not surprising since there may not have been sufficient time for amended water to reach MW-70-PMW10.

6.1.2 CONCEPTUAL SITE MODEL UPDATE

The CSM was updated to provide an analysis and visualization of both the subsurface hydrogeology and dissolved phase plume morphologies. The highlights of the CSM update for the 2010 PMR are summarized as follows:

- Groundwater level elevations have increased approximately 6 feet in all hydrostratigraphic zones since 2009, which may be attributable to an increase in rainfall in WY2010. Hydraulic gradients and directions remain similar to 2009. Groundwater monitoring data does not indicate that the injection of the biobarriers has impacted groundwater flow.
- The updated extent of the 250 µg/L plume for TCE was simulated using EarthVision in two- and three-dimensions and demonstrates that the post-EISB dissolved plume has decreased in width, length and vertical distribution compared to the baseline CSM.
- The dissolved phase plume remains within the POC boundary.
- The lateral extent of the 250 µg/L TCE plume in the Second Sand is generally wider than originally anticipated per the RD (Geosyntec 2006b). The addition of well MW-70-14 to the Second Sand monitoring program in 2009, allowed characterization of the northeastern portion of the dissolved plume.
- The toe of the Second Sand plume, located downgradient of SSB-1, appears to be expanding to the south and southeast, based on increased concentrations of COCs in MW-70-MNA16, MW-70-MNA17, and MW-70-15.
- Soil vapor monitoring at soil vapor wells, constructed at 6 feet bgs, indicates that methanogenesis is occurring in the SATG and SAB areas. However, the methane monitoring plan indicates no harmful vapors in the breathing zones monitored adjacent to utility corridors that may provide a potential pathway to the surface.

6.2 RECOMMENDATIONS

Based on the results of the 2010 PMR at IR Site 70, the following recommendations are made:

1. Due to the lateral extent of TCE concentrations in the Second Sand well MW-70-14, it is recommended that a Second Sand monitoring well, screened in the lower portion of the Second Sand, be installed downgradient of MW-70-14, and to the north/northeast of the SSB-1 (See Figure 4-20 for proposed location).
2. Due to the increased TCE concentrations in the toe of the dissolved COC plume in the Second Sand, this area will need to be monitored closely to ensure that amended water is effectively dechlorinating the Second Sand downgradient of the SSB-1.

Pending results of COCs in the Second Sand during the next monitoring period, additional injection wells may be considered.

3. It is not anticipated that additional EVO and/or KB-1® is required during 2011. However, additional assessment will be made at the next annual groundwater monitoring event by reviewing all lines of evidence, including possible increases in ORP and DO, and changes in concentrations of chlorinated ethenes, Dhc/*vcr*A, TOC, and VFAs.
4. In First Sand Biobarrier, FSB-1, it is recommended that well RDO-4 be re-installed and monitored in 2011 to determine whether the recirculation of EVO and KB-1® between adjacent wells FSB-114 and FSB-115 in 2010 was sufficient in distributing the EVO and KB-1®, or whether additional injection in RDO-4 is required.
5. Since methane can accumulate in the subsurface and migrate to the surface, continued monitoring of methane in the vapor points and monitoring at the surface is recommended. Special care (venting, explosion-proof meters, etc.) must be taken prior to any sampling or intrusive activities in this area to minimize the risk of fire or explosion. A methane monitoring plan has been put in place to ensure that onsite workers are protected.
6. The data presented in the 2010 PMR support the remedial action goals for IR Site 70 (Geosyntec 2006a) and demonstrate the remedial action is reducing the contaminant concentrations at IR Site 70. The frequency of the groundwater monitoring at IR Site 70 was affected by the continuing resolution of the federal government in early 2011. The Navy will conduct a quarterly monitoring event between the next two sampling events: July 2011 and October 2011, as proposed in Table 6-1. The data acquired during this quarterly event will be evaluated to determine the next frequency of groundwater monitoring at IR Site 70 and will be presented in the 2011 PMR.

Notes:

— - not analyzed

Anions/TDS/Alkalinity - Anions (EPA Method 300.0)/TDS (EPA Method 2540C)/Alkalinity (EPA Method 2320B)
Dhc/vcrA - Polymerase Chain Reaction Assay (Dehalococcoides/vinyl chloride reductase A gene)
DHGs - dissolved hydrogen gases (RSK 175)
dissolved metals - iron, manganese, and arsenic (EPA Method 6010B)
field parameter (pH, dissolved oxygen, oxidation-reduction potential, specific conductance, temperature, and turbidity)
sulfide - total dissolved hydrogen sulfide (EPA Method 4500F)
Soil Vapor samples analyzed for hydrogen sulfide (ASTM D5504) and methane(25C)
TOC - total organic carbon (EPA Method 5310B)
VFAs - volatile fatty acids (300.0M)
VOCs - volatile organic compounds (EPA Method 8260B)

FIELD SAMPLE COLLECTION AND PURGE LOGS

SOURCE AREA TREATMENT

GROUNDWATER COLLECTION AND SAMPLING LOG
MONITORING WELL ID# PMW01A

Project Name: IRP Site 70, NWS Seal Beach
Project Number: 04-14114
Navy Contract No: N68711-04D-1107
Site Engineers: B. Gober / C. Brogdon
Date: 9/3/10

INSIGHT Environmental Technology and Consulting, Inc.
formerly GEOFON INCORPORATED
22632 Golden Springs Dr., Suite 270
Diamond Bar, CA. 91765
Telephone: (909) 396-7662
Fax: (909) 396-1455

PURGE VOLUME CALCULATION (casing volume)

Depth to Water (ft.) _____
Depth to Sediment (ft.) _____
Water Column Height (ft.) _____
Casing Diameter (ft.) 0.25

h - Length of discharge tubing _____
D - diameter of discharge tubing (inches) 0.375
TV - Volume of tubing (mL) _____
[TV (mL) = 155*D²h]
BV - Bladder volume (mL) 300
Sampling system volume (mL) [SSV = TV + BV] _____

PURGE METHOD

[ ] Bailer - Type: _____
[X] Pump - Type: QED Dedicated Bladder Pump (25-35')

FIELD PARAMETER MEASUREMENTS

Time	Depth to Water (ft.)	Flow Rate (mL/min)	Purge Volume (Liters)	Temp (°C)	Conductivity ~~(µS/cm)~~ (S/m)	D.O. (mg/L)	pH	ORP (mV)	Turbidity (NTU)	Comments (Well cond, Color, Clarity Odor)
0935		25 mL/m	Ø	23.50	0.630	0.40	5.64	-225	433.0

PURGE VOLUME CALCULATION (casing volume)

Depth to Water (ft.) ____
Depth to Sediment (ft.) ____
Water Column Height (ft.) ____
Casing Diameter (ft.) 0.25

h - Length of discharge tubing ____
D - diameter of discharge tubing (inches) 0.375
TV - Volume of tubing (mL) ____
[TV (mL) = 155*D²h]
BV - Bladder volume (mL) 300
Sampling system volume (mL) [SSV = TV + BV] ____

PURGE METHOD

[ ] Bailer - Type: ____
[X] Pump - Type: QED Dedicated Bladder Pump

FIELD PARAMETER MEASUREMENTS

Time	Depth to Water (ft.)	Flow Rate (mL/min)	Purge Volume (Liters)	Temp (°C)	Conductivity ~~(µS/cm)~~ (S/m)	D.O. (mg/L)	pH	ORP (mV)	Turbidity (NTU)	Comments (Well cond, Color, Clarity Odor)
0811		75mL/m	Ø	22.63	0.667	2.15	6.26	-361	43.9	
0815			1.2	22.64	0.745	1.32	6.29	-331	54.5

PURGE VOLUME CALCULATION (casing volume)

Depth to Water (ft.) _____
Depth to Sediment (ft.) _____
Water Column Height (ft.) _____
Casing Diameter (ft.) 0.25

h - Length of discharge tubing _____
D - diameter of discharge tubing (inches) 0.375
TV - Volume of tubing (mL) _____
[TV (mL) = .155*D²h]
BV - Bladder volume (mL) 300
Sampling system volume (mL) [SSV = TV + BV] _____

PURGE METHOD

[ ] Bailer - Type: _____
[X] Pump - Type: QED Dedicated Bladder Pump

FIELD PARAMETER MEASUREMENTS

Time	Depth to Water (ft.)	Flow Rate (mL/min)	Purge Volume (Liters)	Temp (°C)	Conductivity ~~(µS/cm)~~ (S/m)	D.O. (mg/L)	pH	ORP (mV)	Turbidity (NTU)	Comments (Well cond, Color, Clarity Odor)

PURGE VOLUME CALCULATION (casing volume)

Depth to Water (ft.) _____
Depth to Sediment (ft.) _____
Water Column Height (ft.) _____
Casing Diameter (ft.) 0.25

h - Length of discharge tubing _____
D - diameter of discharge tubing (inches) 0.375
TV - Volume of tubing (mL) _____
[TV (mL) = .155*D²h]
BV - Bladder volume (mL) 300
Sampling system volume (mL) [SSV = TV + BV] _____

PURGE METHOD

[ ] Bailer - Type: _____
[X] Pump - Type: QED Dedicated Bladder Pump

FIELD PARAMETER MEASUREMENTS

Time	Depth to Water (ft.)	Flow Rate (mL/min)	Purge Volume (Liters)	Temp (°C)	Conductivity ~~(µS/cm)~~ (S/m)	D.O. (mg/L)	pH	ORP (mV)	Turbidity (NTU)	Comments (Well cond, Color, Clarity Odor)
1130		25 mL/m	0	24.33	1.28	0.81	7.16	-67	7.4	
1133			0.3	23.93	0.707	0.08	7.18	-50	27.8

PURGE VOLUME CALCULATION (casing volume)

Depth to Water (ft.) _____
Depth to Sediment (ft.) _____
Water Column Height (ft.) _____
Casing Diameter (ft.) 0.25

h - Length of discharge tubing _____
D - diameter of discharge tubing (inches) 0.375
TV - Volume of tubing (mL) _____
[TV (mL) = 155*D²h]
BV - Bladder volume (mL) 300
Sampling system volume (mL) [SSV = TV + BV] _____

PURGE METHOD

[ ] Bailer - Type: _____
[X] Pump - Type: QED Dedicated Bladder Pump

FIELD PARAMETER MEASUREMENTS

Time	Depth to Water (ft.)	Flow Rate (mL/min)	Purge Volume (Liters)	Temp (°C)	Conductivity ~~(µS/cm)~~ (S/m)	D.O. (mg/L)	pH	ORP (mV)	Turbidity (NTU)	Comments (Well cond, Color, Clarity Odor)
1149		75 ml/m	~~0~~	22.74	1.83	1.04	7.17	-190	0.0

NOTICE: Turn-around-time (TAT) for samples shall not begin untill all discrepancies have been resolved. For samples received and discrepacies resolved after 1500 hrs, TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associted with sample disposal. Samples shall be disposed of as soon as practical (but not prior to fifteen (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 06/02/10.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
T-8-9	F014-01	06/02/10	WATER	VOLATILE ORGANICS BY GC/MS
				TPH DIESEL
				TPH GASOLINE
B-1-2-3	F014-02	06/02/10	SOIL	TPH GASOLINE
				TPH DIESEL
				METALS BY ICP
				MERCURY
				VOLATILE ORGANICS BY GC/MS

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning these results.

Sincerely yours,

Casper J. Pang
Laboratory Director

Subject: RE: 5 days rush result for Seal Beach IR Site 70 SDG 10F014

Linh,
This SDG is for a waste profile. Could we get a signed cover page for the waste disposal facility?

Thanks,
Nick

Hi Nick,
Attached please find the revised result for VOCs sample F014-01R that I sent to you on 06/09/10.
I apologize for the inconvenience.
If you have any question, please email us.

Thanks

Linh Pham

Hi Nick,
Attached please find result for SDG 10F014.
If you have any question, please email us.

Thanks

Linh Pham

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS
(WATER)

SDG#: 10F014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10F014

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

One (1) water sample was received on 06/02/10 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement except for 1,2,3-Trichlorobenzene, 1,2,4-Trichlorobenzene and Bromomethane in VO05F09B were detected at concentration <1/2 RL . However, analytes were not detected in associated samples. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for VO05F06L/C were all within QC limits.
Percent recoveries for VO05F09L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS
(SOIL)

SDG#: 10F014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10F014

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

One (1) soil sample was received on 06/02/10 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Sample was analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VO02F04L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Sample was analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

VOLATILE ORGANIC INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: EMAX Inc
Lab Code: EMXI Case No.:
Lab File ID: RCP001
Instrument ID: TQ02
GC Column:RTX502.2ID:0.32mm (mm)

Contract: NWS SEAL BEACH, IR SITE 70.
SAS No.: SDG No.: 10F014
BFB Injection Date : 03/02/10
BFB Injection Time : 16:49
Heated Purge: (Y/N) Y

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	16.22
75	30.0 - 60.0% of mass 95	41.39
95	Base peak, 100% relative abundance	100.00
96	5.0 - 9.0% of mass 95	6.51
173	Less than 2.0% of mass 174	0.00(0.0)1
174	Greater than 50% of mass 95	72.74
175	5.0 - 9.0% of mass 174	5.31(7.3)1
176	95.0 - 101.0% of mass 174	70.75(97.3)1
177	5.0 - 9.0% of mass 176	4.48(6.3)2

1-Value is % mass 174 2-Value is % mass 176

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/M8015
TOTAL PETROLEUM HYDROCARBONS BY PURGE AND TRAP

SDG#: 10F014

4666

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10F014

METHOD 5030B/M8015
TOTAL PETROLEUM HYDROCARBONS BY PURGE AND TRAP

One (1) water sample and one (1) soil sample were received on 06/02/10 for TPH Gasoline analysis, Method 5030B/M8015 in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source (ICV). Continuing calibration (CCV) verifications were carried on a frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for VA39F03L/C were all within QC limits.
Percent recoveries for VMF001SL/C were all within QC limits.

Matrix QC Sample
A set of MS/MSD was analyzed with the samples in this SDG.
Percent recoveries for F014-02M/S were within project QC limits.

Surrogate
Surrogate was added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
TOTAL PETROLEUM HYDROCARBONS BY PURGE AND TRAP

Client : INSIGHT EEC, INC.
Project : NWS SEAL BEACH, IR SITE 70.

SDG NO. : 10FD14

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 3520C/3550B/8015 MOD
PETROLEUM HYDROCARBONS BY EXTRACTION

SDG#: 10F014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10F014

METHOD 3520C/3550B/8015 MOD
PETROLEUM HYDROCARBONS BY EXTRACTION

One (1) water sample and one (1) soil sample were received on 06/02/10 for TPH Diesel analysis, Method 3520C/3550B/8015 MOD in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source (ICV). Continuing calibration (CCV) verifications were carried on a frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for DSF007WL/C were all within QC limits.
Percent recoveries for DSF009SL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.
Sample F014-01 displayed lighter hydrocarbons.
Sample F014-02 displayed heavier fuel pattern.

LAB CHRONICLE
PETROLEUM HYDROCARBONS BY EXTRACTION

Client : INSIGHT EEC, INC. SDG NO. : 1CF014
Project : NWS SEAL BEACH, IR SITE 7C. Instrument ID : GCT165

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METALS / MERCURY

SDG#: 10F014

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10F014

METHOD 3050B/6010B
METALS BY TRACE ICP

One (1) soil sample was received on 06/02/10 for Metals by ICP analysis, Method 3050B/6010B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
The sample was analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source. Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for IPF013SL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG. Analytical spike and serial dilution were analyzed for matrix interference evaluation. Results were within method acceptance criteria.

Sample Analysis
The sample was analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10F014

METHOD 7471A
MERCURY BY COLD VAPOR

One(1) soil sample was received on 06/02/10 for Mercury analysis, Method 7471A in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
The sample was analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for HGF006SL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG. Serial dilution was analyzed for matrix interference evaluation. Results were within method acceptance criteria.

Sample Analysis
The sample was analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
MERCURY BY COLD VAPOR

NOTICE: Turn-around date (TAT) for samples shall not begin until all documentation have been received. For samples received and discrepancies resolved after 3:00 p.m., TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associated with sample disposal. Samples shall be disposed of as soon as practical (but not prior to 5 days (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client or dispose at client's expense unless client is notified otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 10G020

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G020

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of ten (10) water samples were received on 07/01/10 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, three (3) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Three (3) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for VO06G04L/C were all within QC limits.
Percent recoveries for VO06G06L/C were all within QC limits.
Percent recoveries for VO06G07L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.
Vials received for samples G013-05, -06 and -08 had bubbles >6mm. The analyses were performed on the vials with the least headspace.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD RSK-175
DISSOLVED GASES

SDG#: 10G020

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G020

METHOD RSK-175
DISSOLVED GASES

A total of nine (9) water samples were received on 07/01/10 for Dissolved Gas analysis, Method RSK-175 in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method and was verified using a secondary source (ICV). All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for DGG002WL/C were all within QC limits.
Percent recoveries for DGG003WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
DISSOLVED GASES

Client : INSIGHT EEC, INC.
Project : NWS SEAL BEACH, LR SITE 70.

SDG NO. : 10G020
Instrument ID : GCT010

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

WET CHEMICAL ANALYSES

SDG#: 10G020

CASE NARRATIVE

Client : TWRIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G020

METHOD 300.0(M)
ORGANIC ACIDS BY IC

A total of nine (9) water samples were received on 07/01/10 for Organic Acids (Acetate, Bucyrate, Lactate and Propionate) by IC analysis, Method 300.0(M) in accordance with Methods for the Determination of Inorganic Substances in Environmental Samples (EPA/600/R-93/100).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary forms for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for HCG001WL/C were all within QC limits.
Percent recoveries for HCG002WL/C were all within QC limits.

Matrix QC Sample
Matrix QC sample was analyzed at the frequency prescribed by the project.
Percent recovery for G020-01M was within project QC limits.
Sample duplicate was also analyzed with the samples. RPD was within project limit.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

CASE NARRATIVE

Client : INSIGHT ERC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G020

METHOD SM5310B
TOC

A total of nine (9) water samples were received on 07/01/10 for Total Organic Carbon analysis, Method SM5310B in accordance with Standard Methods for the Examination of Water and Wastewater, 18th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary forms for details.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for TCG003WL/C were all within QC limits.
Percent recoveries for TCG004WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Subject: Laboratory Report
Project: NWS SEAL BEACH, IR SITE 70.

Enclosed is the Laboratory report for samples received on 07/12/10.
The data reported relate only to samples listed below :

Sample ID	Control #	Col Date	Matrix	Analysis
T-07	G092-01	07/12/10	WATER	VOLATILE ORGANICS BY GC/MS
				TPH DIESEL
				TPH GASOLINE

The results are summarized on the following pages.

Please feel free to call if you have any questions concerning these results.

Sincerely yours,

Casper J. Pang
Laboratory Director

This report is confidential and intended solely for the use of the individual or entity to whom it is addressed. This report shall not be reproduced except in full or without the written approval of EMAX.

EMAX certifies that the results included in this report meet all NELAC requirements unless noted in the Case Narrative.

NOTICE: Turn-around-time (TAT) for samples shall not begin until all discrepancies have been resolved. For samples received and documentation received after 1500 hrs. TAT shall start at 0800 hrs the next business day. The client is responsible for all cost associated with sample disposal. Samples shall be disposed of as soon as practical (but not prior to 60days (15) calendar days) after issuance of analytical report unless a different sample disposal schedule is pre-arranged with EMAX. Disposal fee for samples defined by CA Title 22 as non-hazardous shall be $5.00 per sample. EMAX will return hazardous samples to the client at the client's expense unless directed in writing otherwise.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 10G092

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G092

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

One (1) water sample was received on 07/12/10 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
The sample was analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VO05G11L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
The sample was analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

VOLATILE ORGANIC INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: EMAX Inc
Lab Code: EMXT Case No.:
Lab File ID: RFQ352
Instrument ID: TQ05
GC Column:RTX502.2ID;0.32mm (mm)

Contract: NWS SEAL BEACH, IR SITE 70.
SAS No.: SDG No.: 100092
BFB Injection Date : 06/19/10
BFB Injection Time : 09:37
Heated Purge: (Y/N) N

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	19.53
75	30.0 - 60.0% of mass 95	47.08
95	Base peak, 100% relative abundance	100.00
96	5.0 - 9.0% of mass 95	6.82
173	Less than 2.0% of mass 174	0.00(0.01)
174	Greater than 50% of mass 95	75.63
175	5.0 - 9.0% of mass 174	5.85(7.73)
176	95.0 - 101.0% of mass 174	72.00(95.23)
177	5.0 - 9.0% of mass 176	5.30(7.42)

1-Value is % mass 174 2-Value is % mass 176

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/M8015
TOTAL PETROLEUM HYDROCARBONS BY PURGE AND TRAP

SDG#: 10G092

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G092

METHOD 5030B/M8015
TOTAL PETROLEUM HYDROCARBONS BY PURGE AND TRAP

One (1) water sample was received on 07/12/10 for TPH Gasoline analysis, Method 5030B/M8015 in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
The sample was analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source (ICV). Continuing calibration (CCV) verifications were carried on a frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for VA39G04L/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogate was added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
The sample was analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
TOTAL PETROLEUM HYDROCARBONS BY PURGE AND TRAP

Client : INSIGHT EEC, INC.
Project : NWS SEAL BEACH, CR SITE 70.

SDG NO. : 10G092

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 3520C/8015 MOD
PETROLEUM HYDROCARBONS BY EXTRACTION

SDG#: 10G092

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10G092

METHOD 3520C/8015 MOD
PETROLEUM HYDROCARBONS BY EXTRACTION

One (1) water sample was received on 07/12/10 for TPH Diesel analysis, Method 3520C/8015 MOD in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
The sample was analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source (ICV). Continuing calibration (CCV) verifications were carried on a frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for DSG017WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated in this SDG.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
The sample was analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.
Sample G092-01 displayed mixed fuel pattern.

LAB CHRONICLE
PETROLEUM HYDROCARBONS BY EXTRACTION

Client : INSIGHT EEC, INC. SDG NO. : 1C3092
Project : NWS SEAL BEACH, CR SITE 70. Instrument ID : GC11C5

Subject: RE: VFA only

Ye,

Sorry for all the confusion on this. For clarity here are the samples and what we need to do:

These 6 samples:
IW-70-SAB03-P13
IW-70-SAB11-P13
IW-70-SAB11-P13D
IW-70-SHB311-P13
IW-70-SHB319-P13
IW-70-SSB119-P13

Will require the following tests:
VOC's by 8260B
Dissolved Gasses by RSK-175
VFAs by 300.0M
TOC by 5310B

Again, sorry for all the confusion on this.

Thanks,
-Nick

Nick,

Could you please confirm we do not need TOC? It looks like we will be performing VOCs and dissolved gases only for these 6 samples.
Thanks.

Ye,
Correction below in RED. Sample is IW-70-SSB119-P13, NOT IW-70-SSB319-P13. Again, these 6 samples only require VFAs, not Alkalinity, TOC, or Anions.

Thanks,
Nick

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than RL but greater than MDL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

ACRONYMS AND ABBREVIATIONS:

CRDL	Contract Required Detection Limit
RL	Reporting Limit
MRL	Method Reporting Limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
DO	Diluted out

DATES

The date and time information for leaching and preparation reflect the beginning date and time of the procedure unless the method, protocol, or project specifically requires otherwise.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

SDG#: 10H661

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD 5030B/8260B
VOLATILE ORGANICS BY GC/MS

A total of ten (10) water samples were received on 08/31/10 for Volatile Organics by GC/MS analysis, Method 5030B/8260B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Instrument Performance and Calibration
Instrument tune check was performed prior to calibration. Instrument mass ratios were within specification. Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using secondary source (ICV). Continuing calibration (CCV) was carried on at a frequency required by the project. All project calibration requirements were satisfied. Refer to calibration summary forms for ICAL, ICV and CCV for details.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for VO94I03L/C were all within QC limits.
Percent recoveries for VO94I06L/C were all within QC limits.

Matrix QC Sample
A set of MS/MSD was analyzed with the samples in this SDG.
Percent recoveries for H661-05M/S were within project QC limits.

Surrogate
Surrogates were added on QC and field samples. Surrogate recoveries were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. Manual integration was applied to one analyte in sample H661-05R because of improper integration. Hence, the original chromatograms were retained with the initialed and dated corrected chromatograms. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

IS1 (DFB) = 1,4-Difluorobenzene
IS2 (CBZ) = Chlorobenzene-d5
IS3 (DCB) = 1,2-Dichlorobenzene-d4

AREA UPPER LIMIT = + 100% of internal standard area
AREA LOWER LIMIT = - 50% of internal standard area
AREA UPPER LIMIT = + 50% of surrogate area
AREA LOWER LIMIT = - 50% of surrogate area

Column used to flag internal standard area values with an asterisk
* Values outside of QC limits.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

METHOD RSK-175
DISSOLVED GASES

SDG#: 10H661

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD RSK-175
DISSOLVED GASES

A total of nine (9) water samples were received on 08/31/10 for Dissolved Gas analysis, Method RSK-175 in accordance with USEPA at R.S. Kerr Environmental Research Laboratory, Ada, OK 74820 March 15, 1989.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method and was verified using a secondary source (ICV). All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary form for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for DG1003WL/C were all within QC limits.
Percent recoveries for DG1004WL/C were all within QC limits.

Matrix QC Sample
A set of MS/MSD was analyzed with the samples in this SDG.
Percent recoveries were within project QC limits except for results qualified with [*] in H661-03 M/S summary form, most likely due to matrix interference. Check QC summary form for details.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

LAB CHRONICLE
DISSOLVED GASES

Client : INSIGHT EEC, INC.

METHOD 3010A/6010B
DISSOLVED METALS BY TRACE ICP

SDG#: 10H661

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD 3010A/6010B
DISSOLVED METALS BY TRACE ICP

A total of two (2) water samples were received on 08/31/10 for Dissolved Metals by ICP analysis, Method 3010A/6010B in accordance with USEPA SW-846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source. Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for IPI045WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG. Analytical spike and serial dilution were analyzed for matrix interference evaluation. Results were within method acceptance criteria.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter. Sample H661-09 was reported from DF 5 run due to suspected matrix interference from high Calcium and Sodium levels.

LABORATORY REPORT FOR

INSIGHT EEC, INC.

NWS SEAL BEACH, IR SITE 70.

WET CHEMICAL ANALYSES

SDG#: 10H661

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD 300.0
ANIONS BY IC

A total of three (3) water samples were received on 08/31/10 for (Bromide, Chloride, Nitrate-N, Nitrite-N and Sulfate) Anions by IC analysis, Method 300.0 in accordance with Methods for the Determination of Inorganic Substances in Environmental Samples (EPA/600/R-93/100).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, two (2) method blanks was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for ICH013WL/C were all within QC limits.
Percent recoveries for ICH081WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

Samples H661-08 and H661-09 for Nitrate-N were initially analyzed at 2x due to matrix interference.

Samples H661-08 and H661-09 for Nitrite-N were reported from DF 5x due to matrix interference.

FINAL

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD 300.0(M)
ORGANICS BY IC

A total of nine (9) water samples were received on 08/31/10 for (Acetate, Butyrate, Lactate and Propionate) Organic Acids by IC analysis, Method 300.0(M) in accordance with Methods for the Determination of Inorganic Substances in Environmental Samples (EPA/600/R-93/100).

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Multi-calibration points were generated to establish initial calibration (ICAL). ICAL was verified using a secondary source. Continuing calibration verifications were carried out at the frequency specified by the project. All calibration requirements were within acceptance criteria.

Method Blank
Method blanks were analyzed at the frequency required by the project. For this SDG, two (2) method blanks were analyzed with the samples. All results were compliant to project requirement. Refer to QC result summary forms for details.

Lab Control Sample
Two (2) sets of LCS/LCD were analyzed with the samples in this SDG.
Percent recoveries for HCI004WL/C were all within QC limits.
Percent recoveries for HCI008WL/C were all within QC limits.

Matrix QC Sample
Matrix QC sample was analyzed at the frequency prescribed by the project.
Percent recoveries for H661-05M/S were within project QC limits.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

FINAL

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD 2320B
TOTAL ALKALINITY

A total of three (3) water samples were received on 08/31/10 for Alkalinity analysis, Method 2320B in accordance with Standard Methods for the Examination of Water and Wastewater, 20th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries were within QC limits except for one result qualified with [*] in ALI005WL/C summary form. Check QC summary form for details.

Matrix QC Sample
No matrix QC sample was designated for this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

for
ALKALINITY

Note: For samples and relevent QCs/Standards analyzed, refer to attached analytical sequence

Comments:

MS/MSD amount of spike: 0.4ml of SWP1-04-084 (10,000 ppm) was spiked into samples for a final volume of 40ml.

Matrix recovery failed due to matrix interference of sample J005-3

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 10H661

METHOD 2540C
TOTAL DISSOLVED SOLIDS

A total of three (3) water samples were received on 08/31/10 for Total Dissolved Solids analysis, Method 2540C in accordance with Standard Methods for the Examination of Water and Wastewater, 20th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Balance calibration was checked as prescribed by the method. All calibration requirements were within acceptance criteria.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Lab Control Sample
A set of LCS/LCD was analyzed with the samples in this SDG.
Percent recoveries for TDI002WL/C were all within QC limits.

Matrix QC Sample
No matrix QC sample was designated for this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

CASE NARRATIVE

Client : INSIGHT EEC, INC.

Project : NWS SEAL BEACH, IR SITE 70.

SDG : 100661

METHOD 4500F
DISSOLVED HYDROGEN SULFIDE

A total of two (2) water samples were received on 05/31/10 for Dissolved Hydrogen Sulfide analysis, Method 4500F in accordance with Standard Methods for the Examination of Water and Wastewater, 20th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Method Blank
Method blank was analyzed at the frequency required by the project. For this SDG, one method blank was analyzed with the samples. Result was compliant to project requirement.

Matrix QC Sample
No matrix QC sample was designated for this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. All project requirements were met otherwise anomalies were discussed within the associated QC parameter.

METHOD 4500F
Dissolved Hydrogen Sulfide

Client : INSIGHT EEC, INC.
Project : NWS SEAL BEACH, IR SITE 70.

STANDARDIZATION

V_1 (ml)	Titrant (ml)	DATE	TIME	Titrant $Na_2S_2O_3$ (N)
Average Normality of Iodine (N I)=				0.025

☑ Standard Purchased as Certified Solution

$$N_I = \frac{(N \cdot V)_{Na_2S_2O_3}}{V_I}$$

MISCELLANEOUS INFORMATION

Standard	Concentration		Unit
Iodine	0.025		N
$Na_2S_2O_3$	0.025		N
LCS [WATER / SOIL]	6.79	444	mg/L / mg/Kg
MDL [WATER / SOIL]	0.4	10	mg/L / mg/Kg
RL	2	20	mg/L / mg/Kg

$$S(mg/L) = \frac{[(V_I * N_I) - (V_t * N_t)](16,000)}{V_s}$$

MS/MSD	TV=	6.79	mg/L
ID	Result (mg/L)	%Rec.	RPD

METHOD SM5310B
TOC

A total of nine (9) water samples were received on 08/31/10 for Total Organic Carbon analysis, Method SM5310B in accordance with Standard Methods for the Examination of Water and Wastewater, 18th Edition.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
