Naval Air Station Jacksonville

Do you have any information about the historical use or disposal of radiological material at Naval Air Station (NAS) Jacksonville?

The U.S. Navy is conducting an assessment regarding the historical use and disposal of general radioactive materials (G-RAM) at NAS Jacksonville and its outlying properties (Outlying Landing Field Whitehouse and Rodman Range). One known source of G-RAM was the use and refurbishment of radium dials and gauges associated with aircraft maintenance activities beginning in the 1940s. Examples of other G-RAM include radioluminescent personnel markers, deck markers, electron tubes, thoriated welding rods, certain types of engine exciters, thorium lenses, radioisotopes, and depleted uranium counterweights. If you have any information about the historical use or disposal of radiological material at NAS Jacksonville or one of its outlying properties, the Navy would appreciate your input and recollections. If you would like to participate in an interview and/or wish to provide your recollections, please dial 844-236-0390 or email HRA_JacksonvilleNAS@aecom.com and provide your contact information. All information provided will be considered in the preparation of an assessment report for NAS Jacksonville. Please note that all comments, including personal information provided, are subject to the Freedom of Information Act and may be made publicly available at any time.
